BestOrderFlow.com

Objectives

1) Price run from liquidity to liquidity.

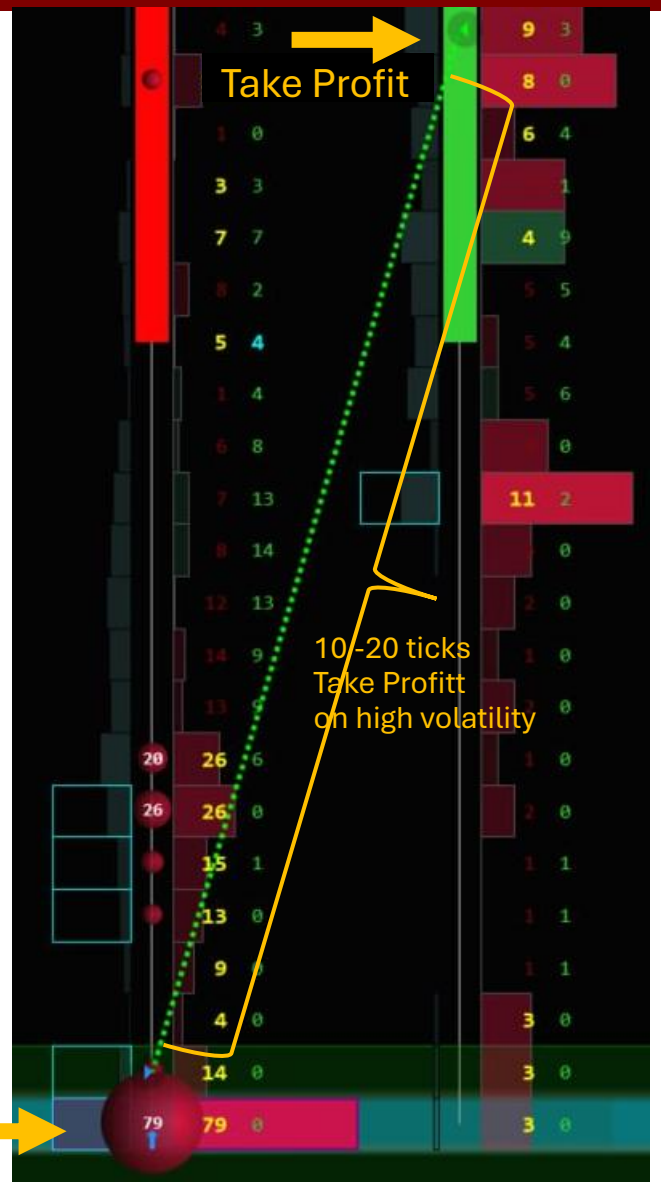

2) Focus on largest liquidity on level 2 and do not trade between upper and lower liquidity channel. There are another trading systems for that.

3) Trade alongside big players abnormally large orders.

4) In this strategy we focus to trade price reaction.

- This is it . Nothing else.
- Do not overcomplicate.
- It is simple as simple can be.
- The “less” is “more” for this strategy.

5) One strategy at a time. Don’t combine this strategy with any other strategy until getting consistent results and master this strategy alone.

1) Enter trades with Limit orders/ resting waiting orders. No entries by Market

2) Indicators:
- Pack 4 MBO Dom – main indicator.

3) - Pack 2 - Bookmap NT: Heatmap NT, Market Delta NT.
All other indicators must be removed and cleaned from the chart.

4) Avoid low volatility

5) Instruments: MNQ or MES - trade micros with one contract.

BestOrderFlow.com

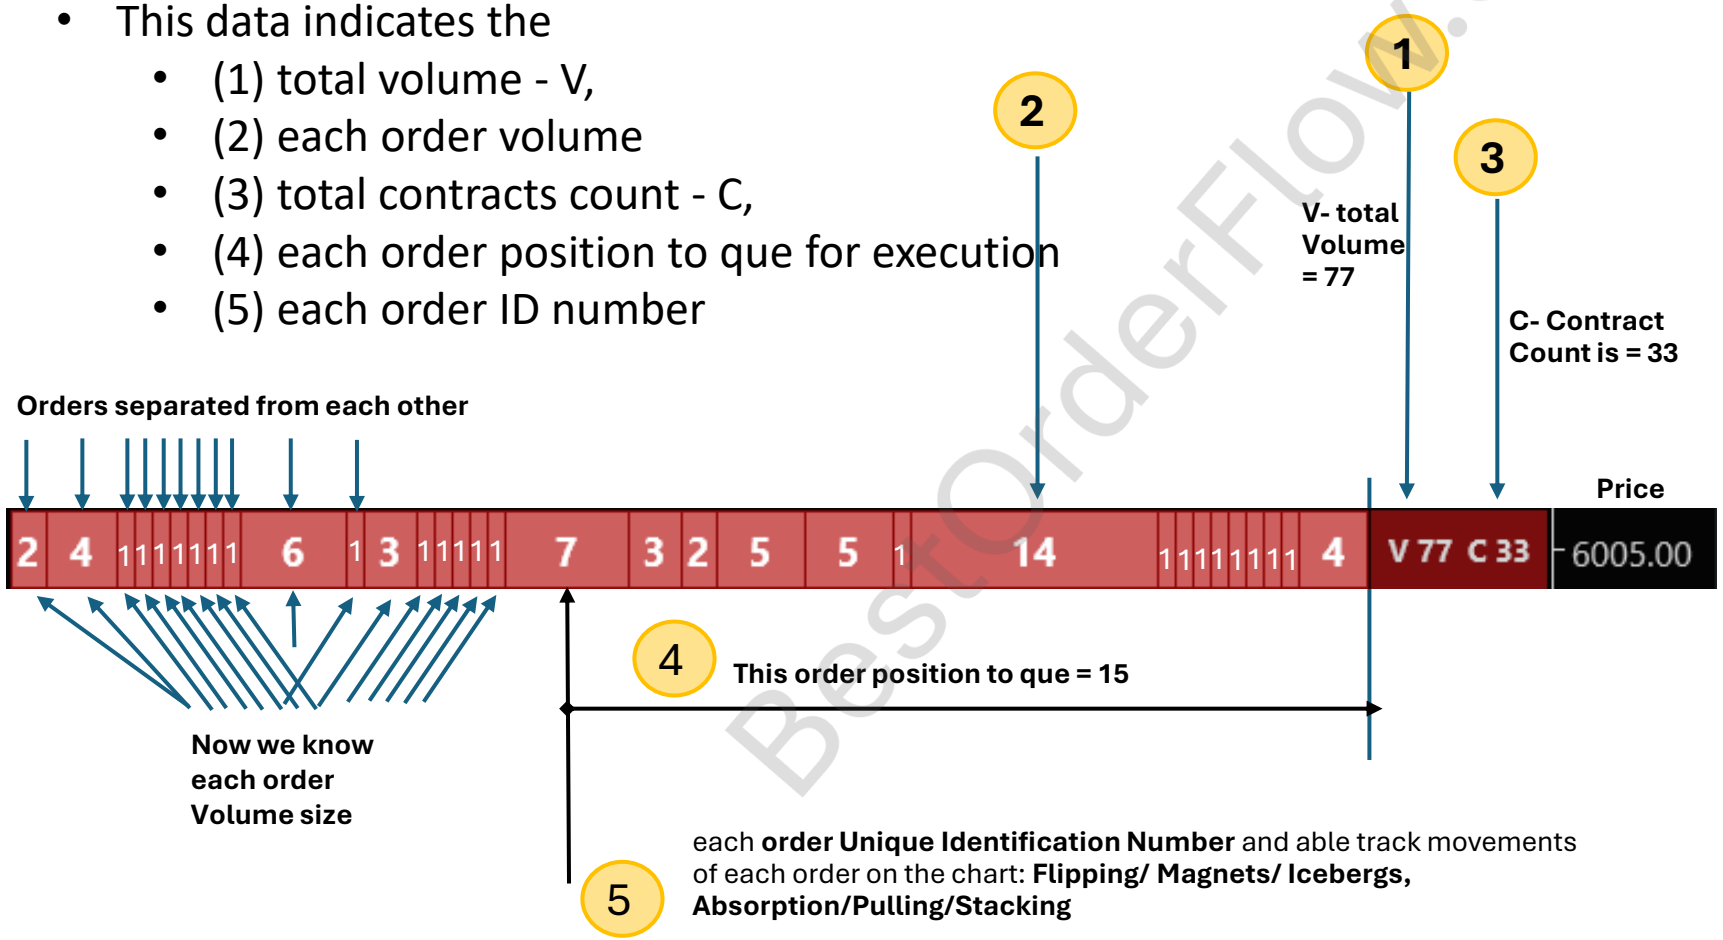

Market By Order - MBO Dom indicator

BestOrderFlow.com

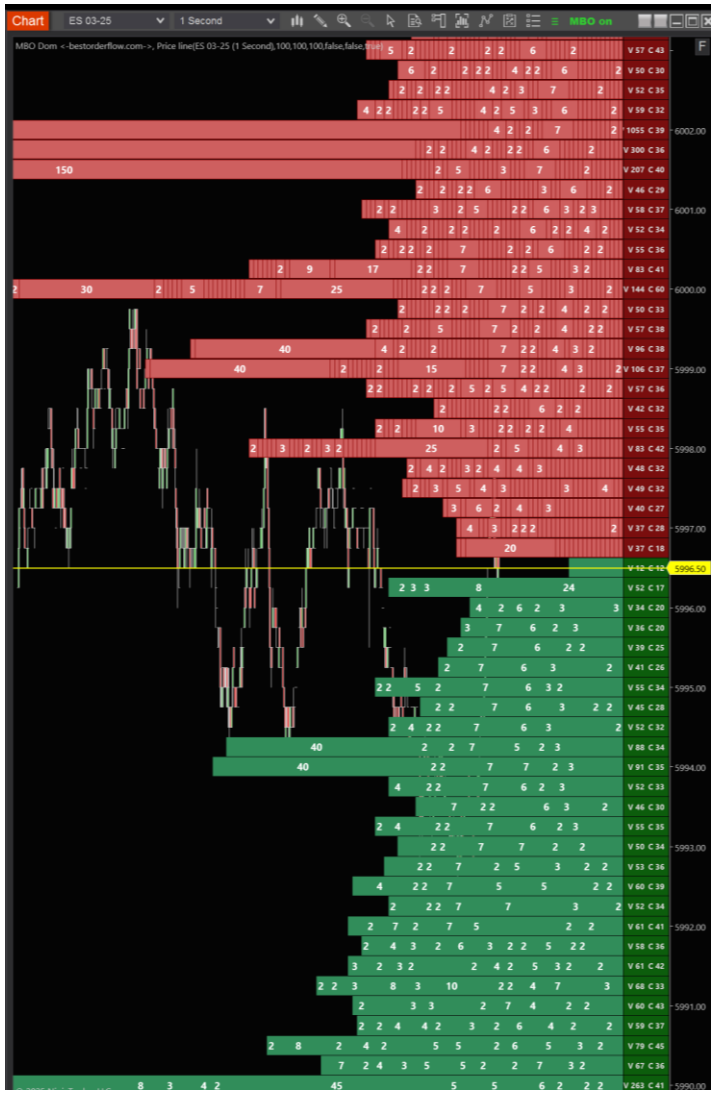

A transparent picture of the full depth of the order book on level 3 data

- Market by order data is **passive/limits** order details in the order book.

- This data indicates the
  - (1) total volume - V,
  - (2) each order volume
  - (3) total contracts count - C,
  - (4) each order position to que for execution
  - (5) each order ID number

BestOrderFlow.com

BestOrderFlow.com

Indicator HeatMap NT

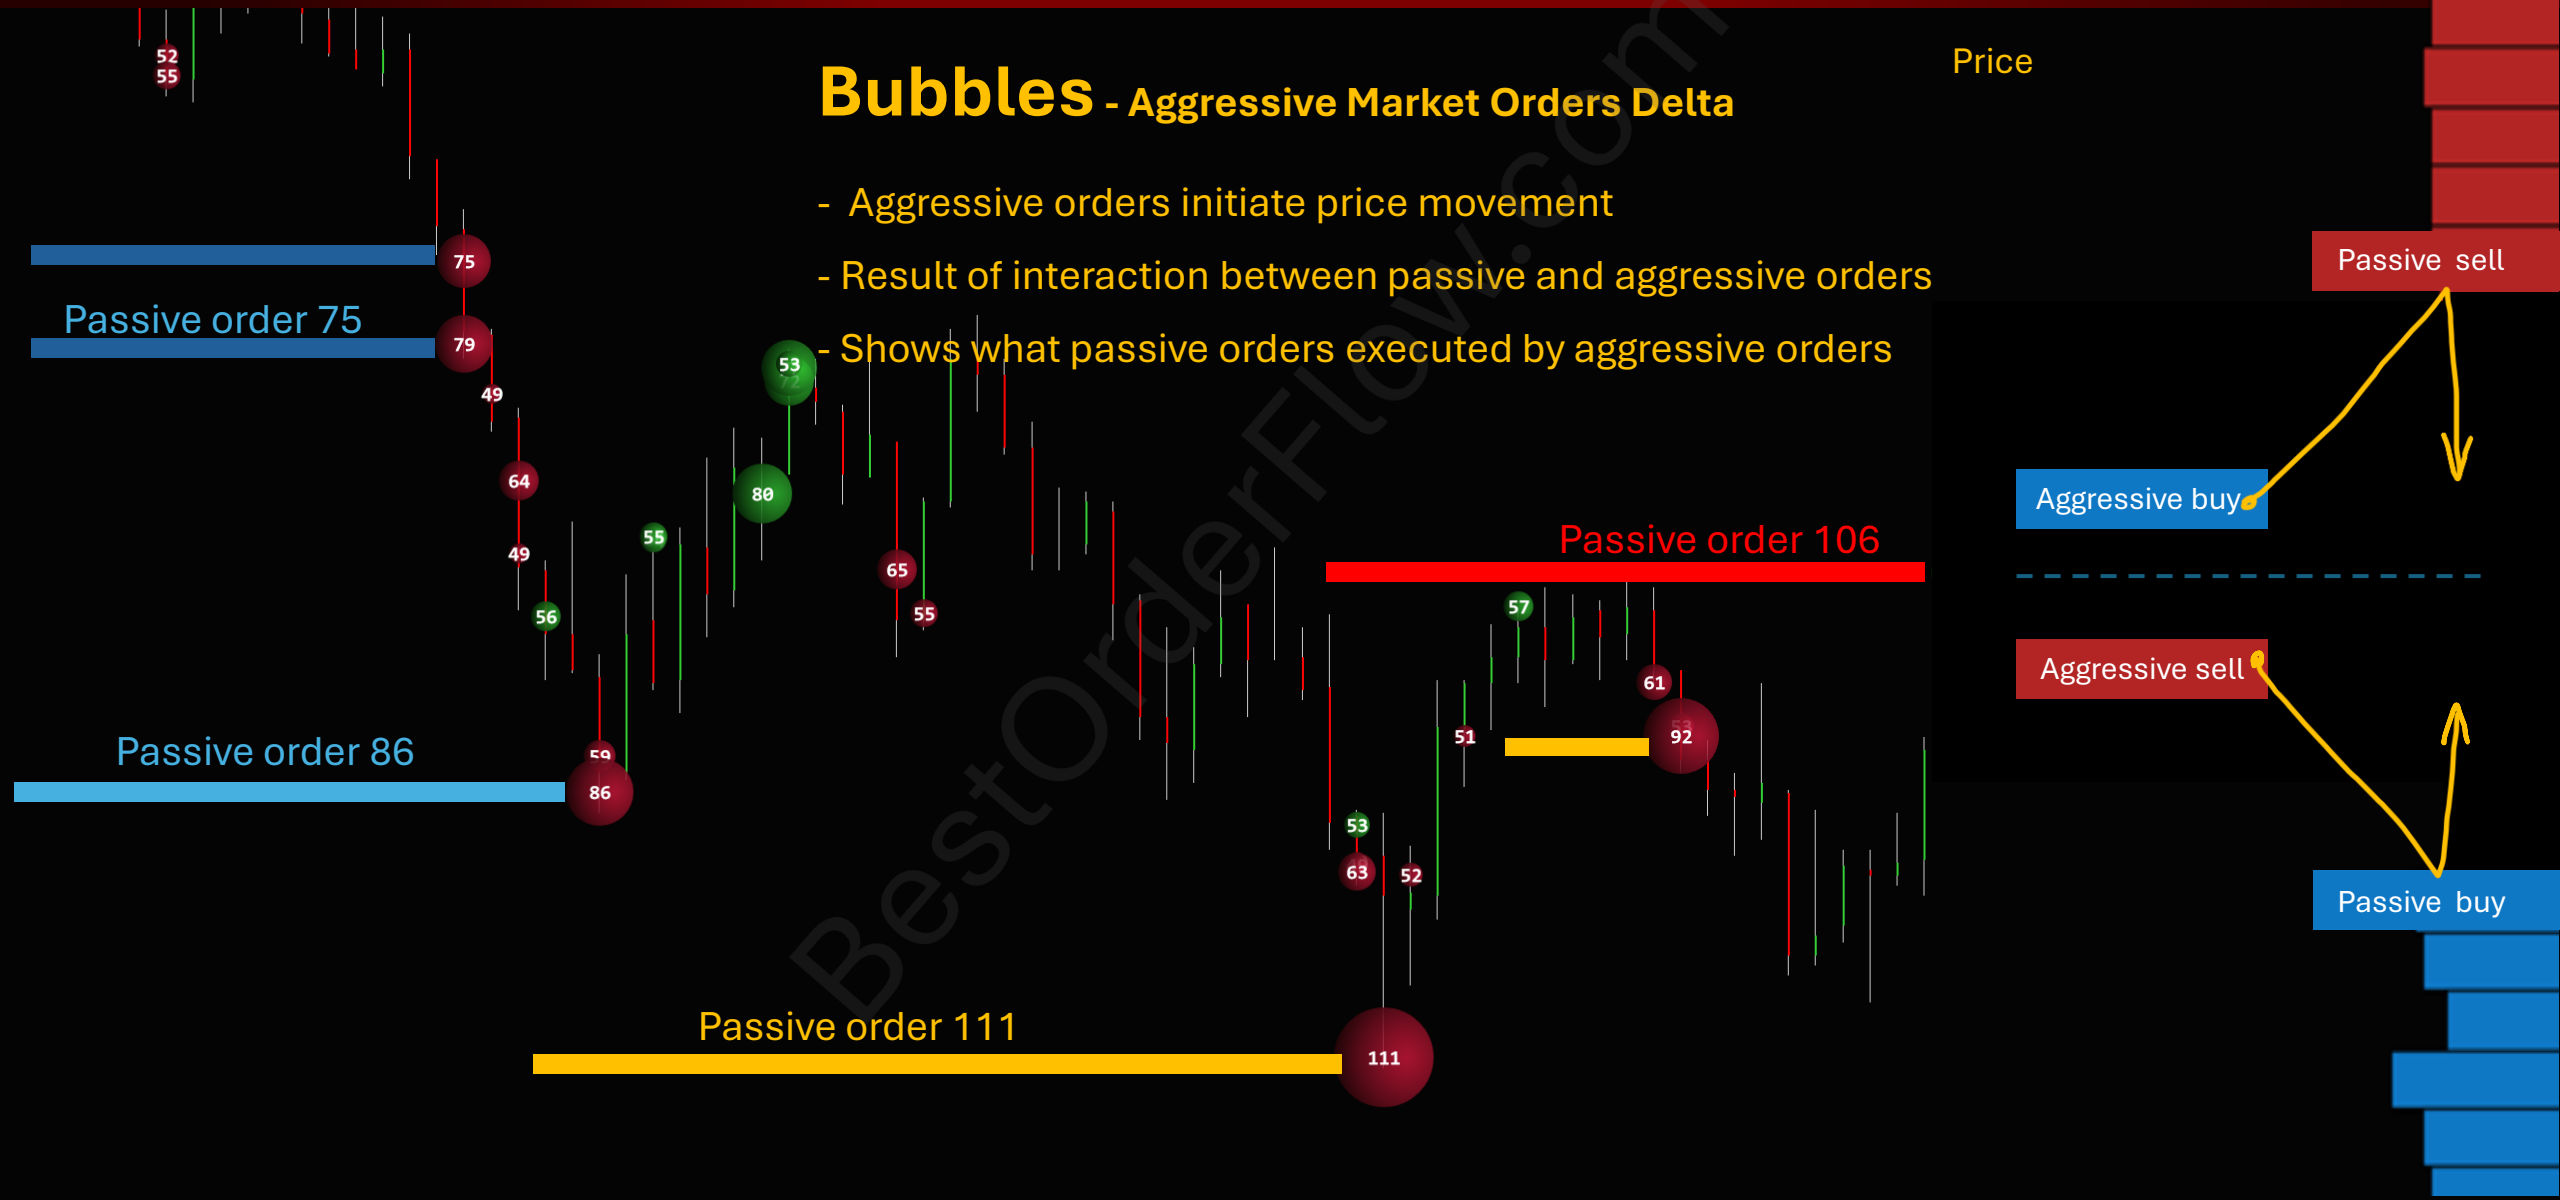

1) Passive/limit/resting orders length time

2) Passive/limit/resting orders volume by size and color

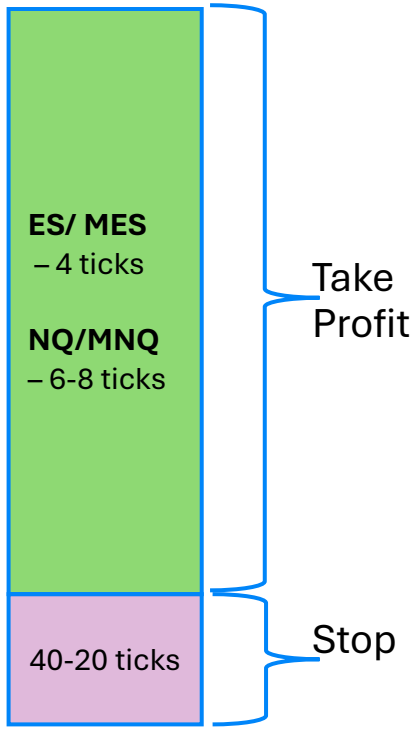

Indicator Market Delta NT

BestOrderFlow.com

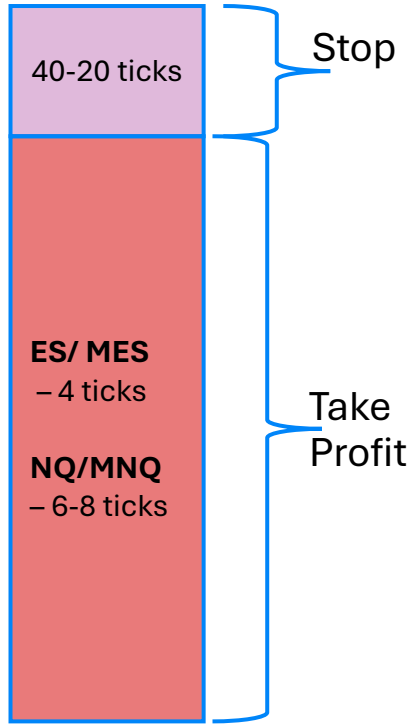

Stop Loss and Take Profit

BestOrderFlow.com

1) Take profit on **ES = 4** ticks , on **MNQ = 6-8** ticks
2) Set automatic Stop loss on ATM = 40 ticks as initial Stop
3) Adjust stop loss immediately, by placing SL behind closest high-volume order for protection and minimize risks to **20** ticks
4) Number of contracts: use the same numbers of contracts for every entry during that trading session.
5) Indicator Trades from BOF Pack 1 helps with trades visualization and instant analysis.

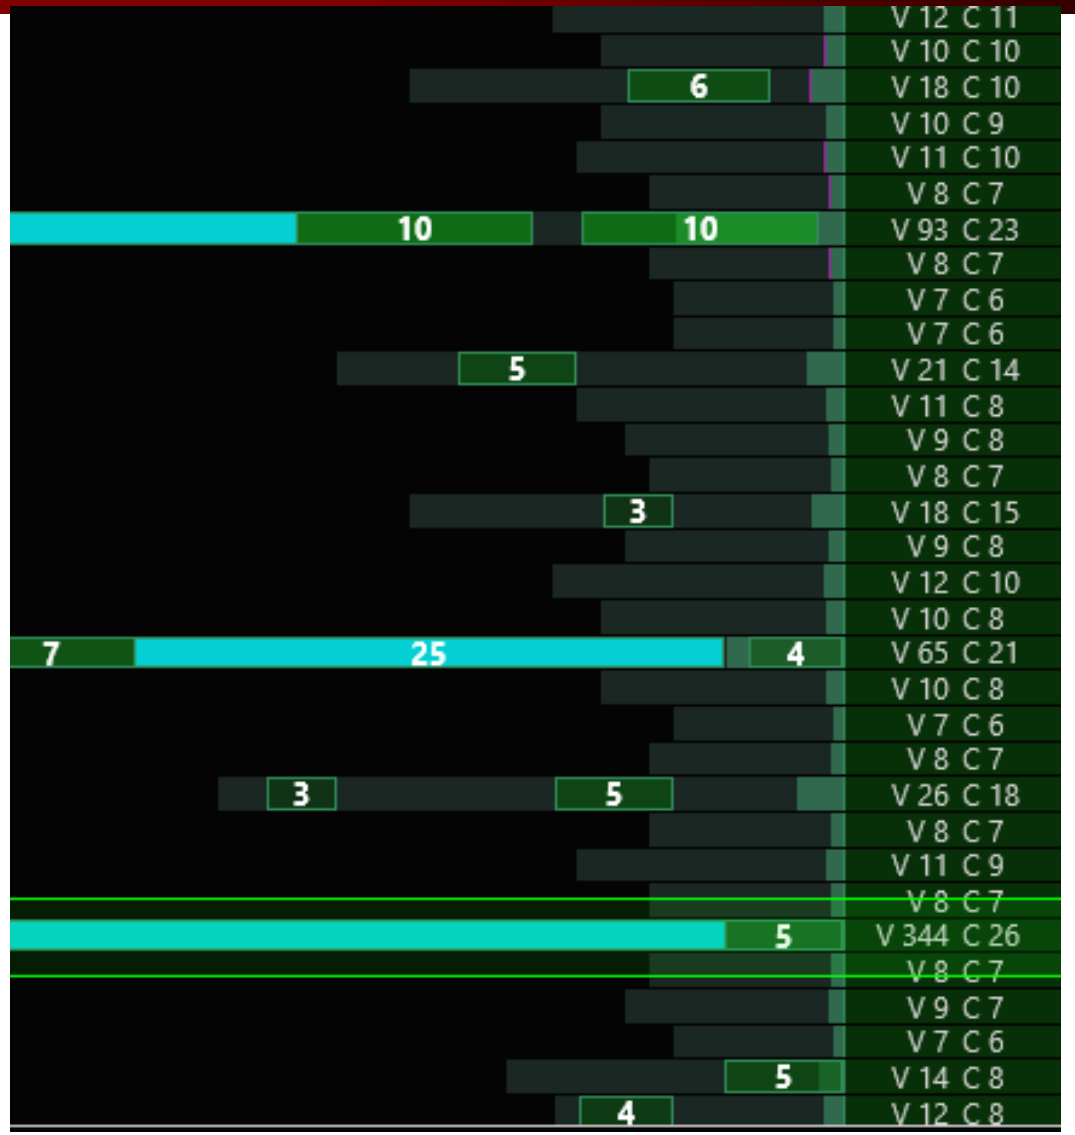

BestOrderFlow.com

4 Qualifying factors

BestOrderFlow.com

1) Volume size
2) Historical time of the large order
3) Distance of the large order to the que
4) Moving Speed and Imbalance:

- strike from far away- from a distance
- Impulse with extended candle bar
- Avoid price approaching with a slow range and short candles

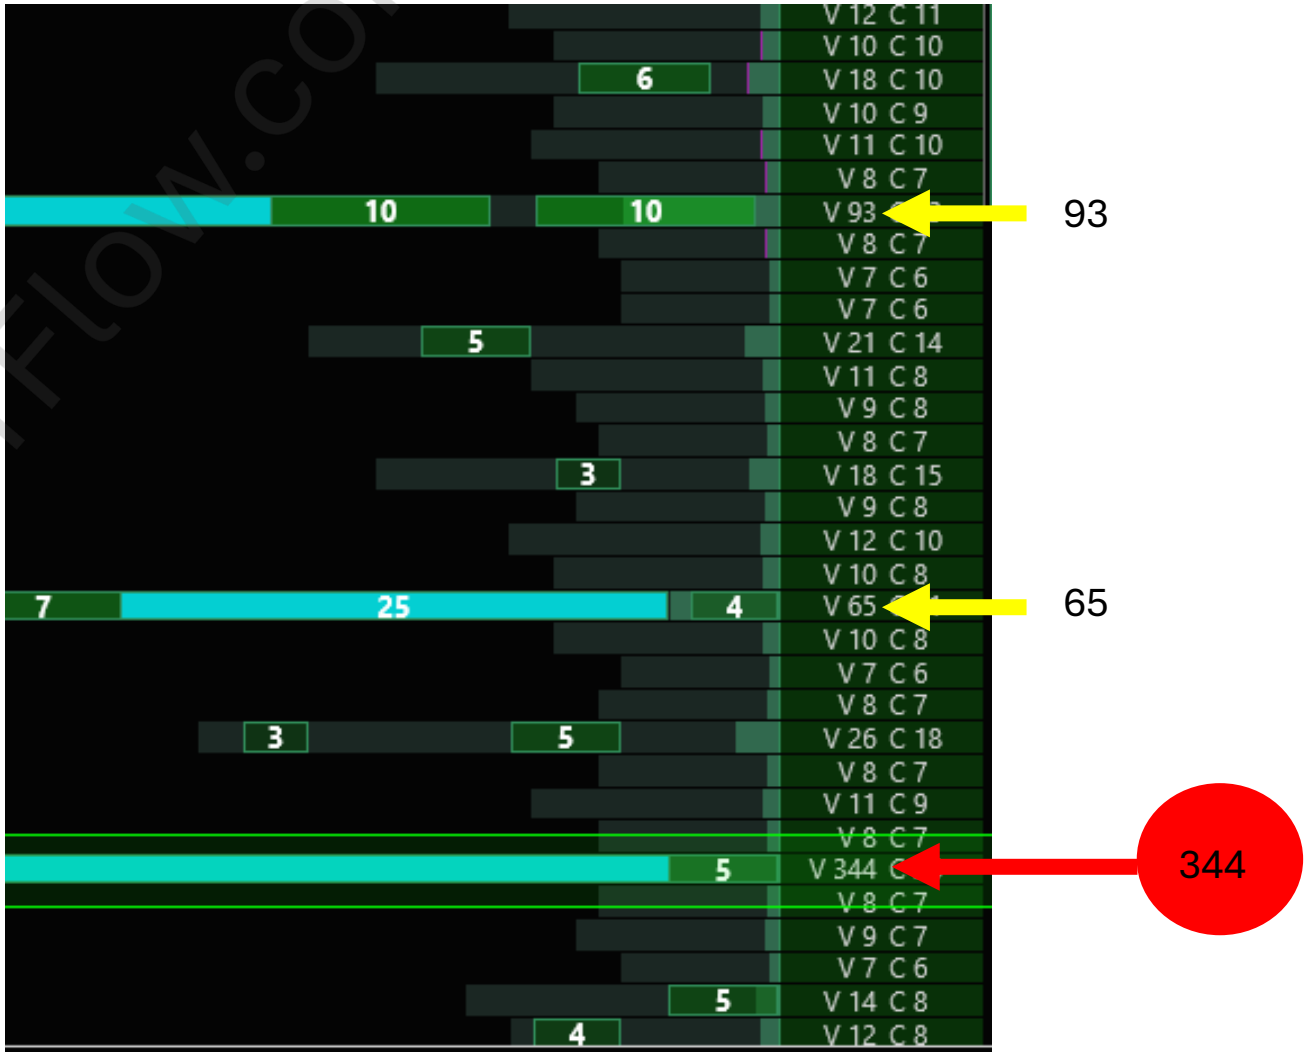

BestOrderFlow.com

1) Abnormal Total Volume

BestOrderFlow.com

1) Volume size : 10x above average – **Abnormal Volume**

BestOrderFlow.com

2) Historical Time Spent on Heatmap NT

BestOrderFlow.com

Time: historical time on the price level

10 bars = 3 min

ES on 30 sec time frame

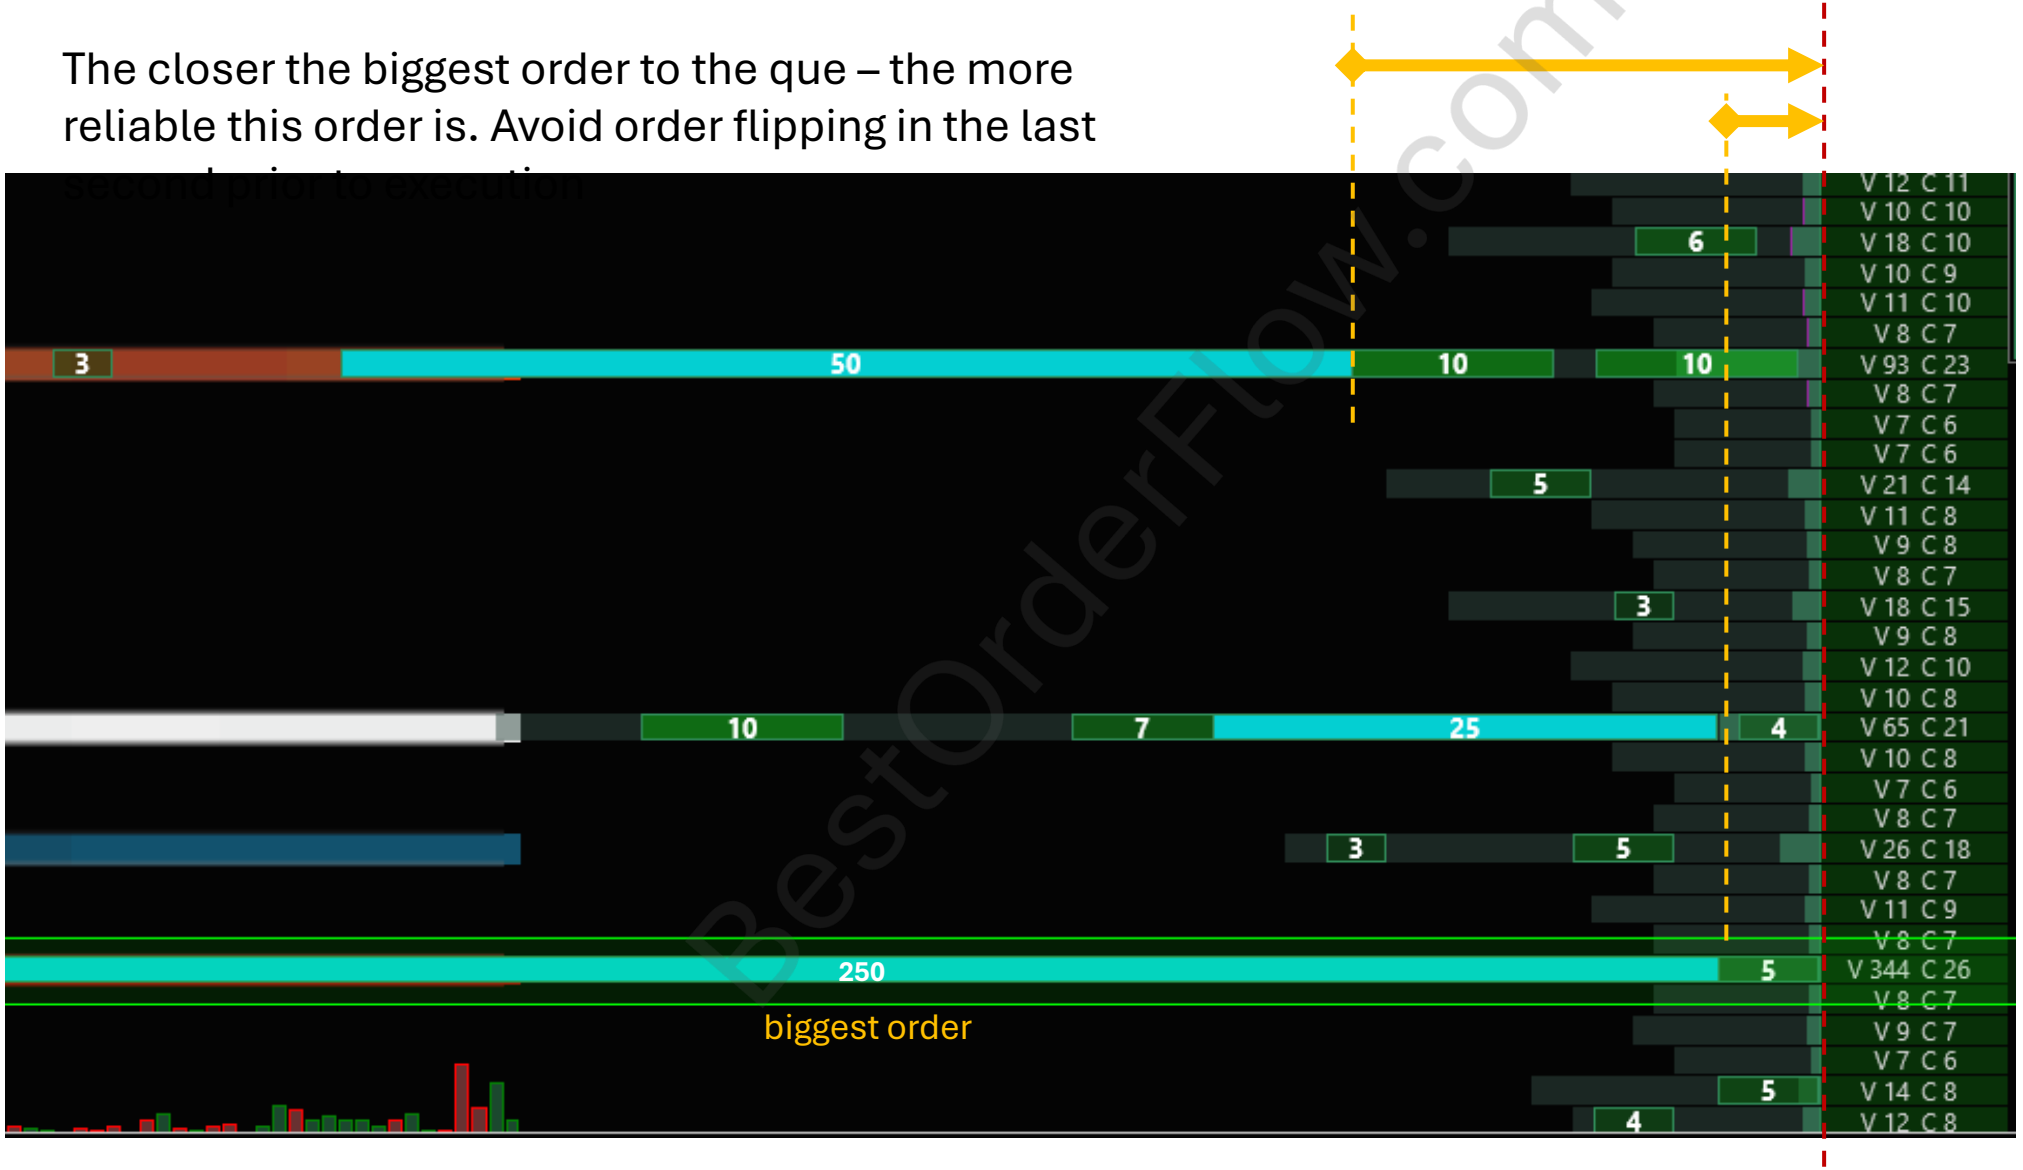

BestOrderFlow.com

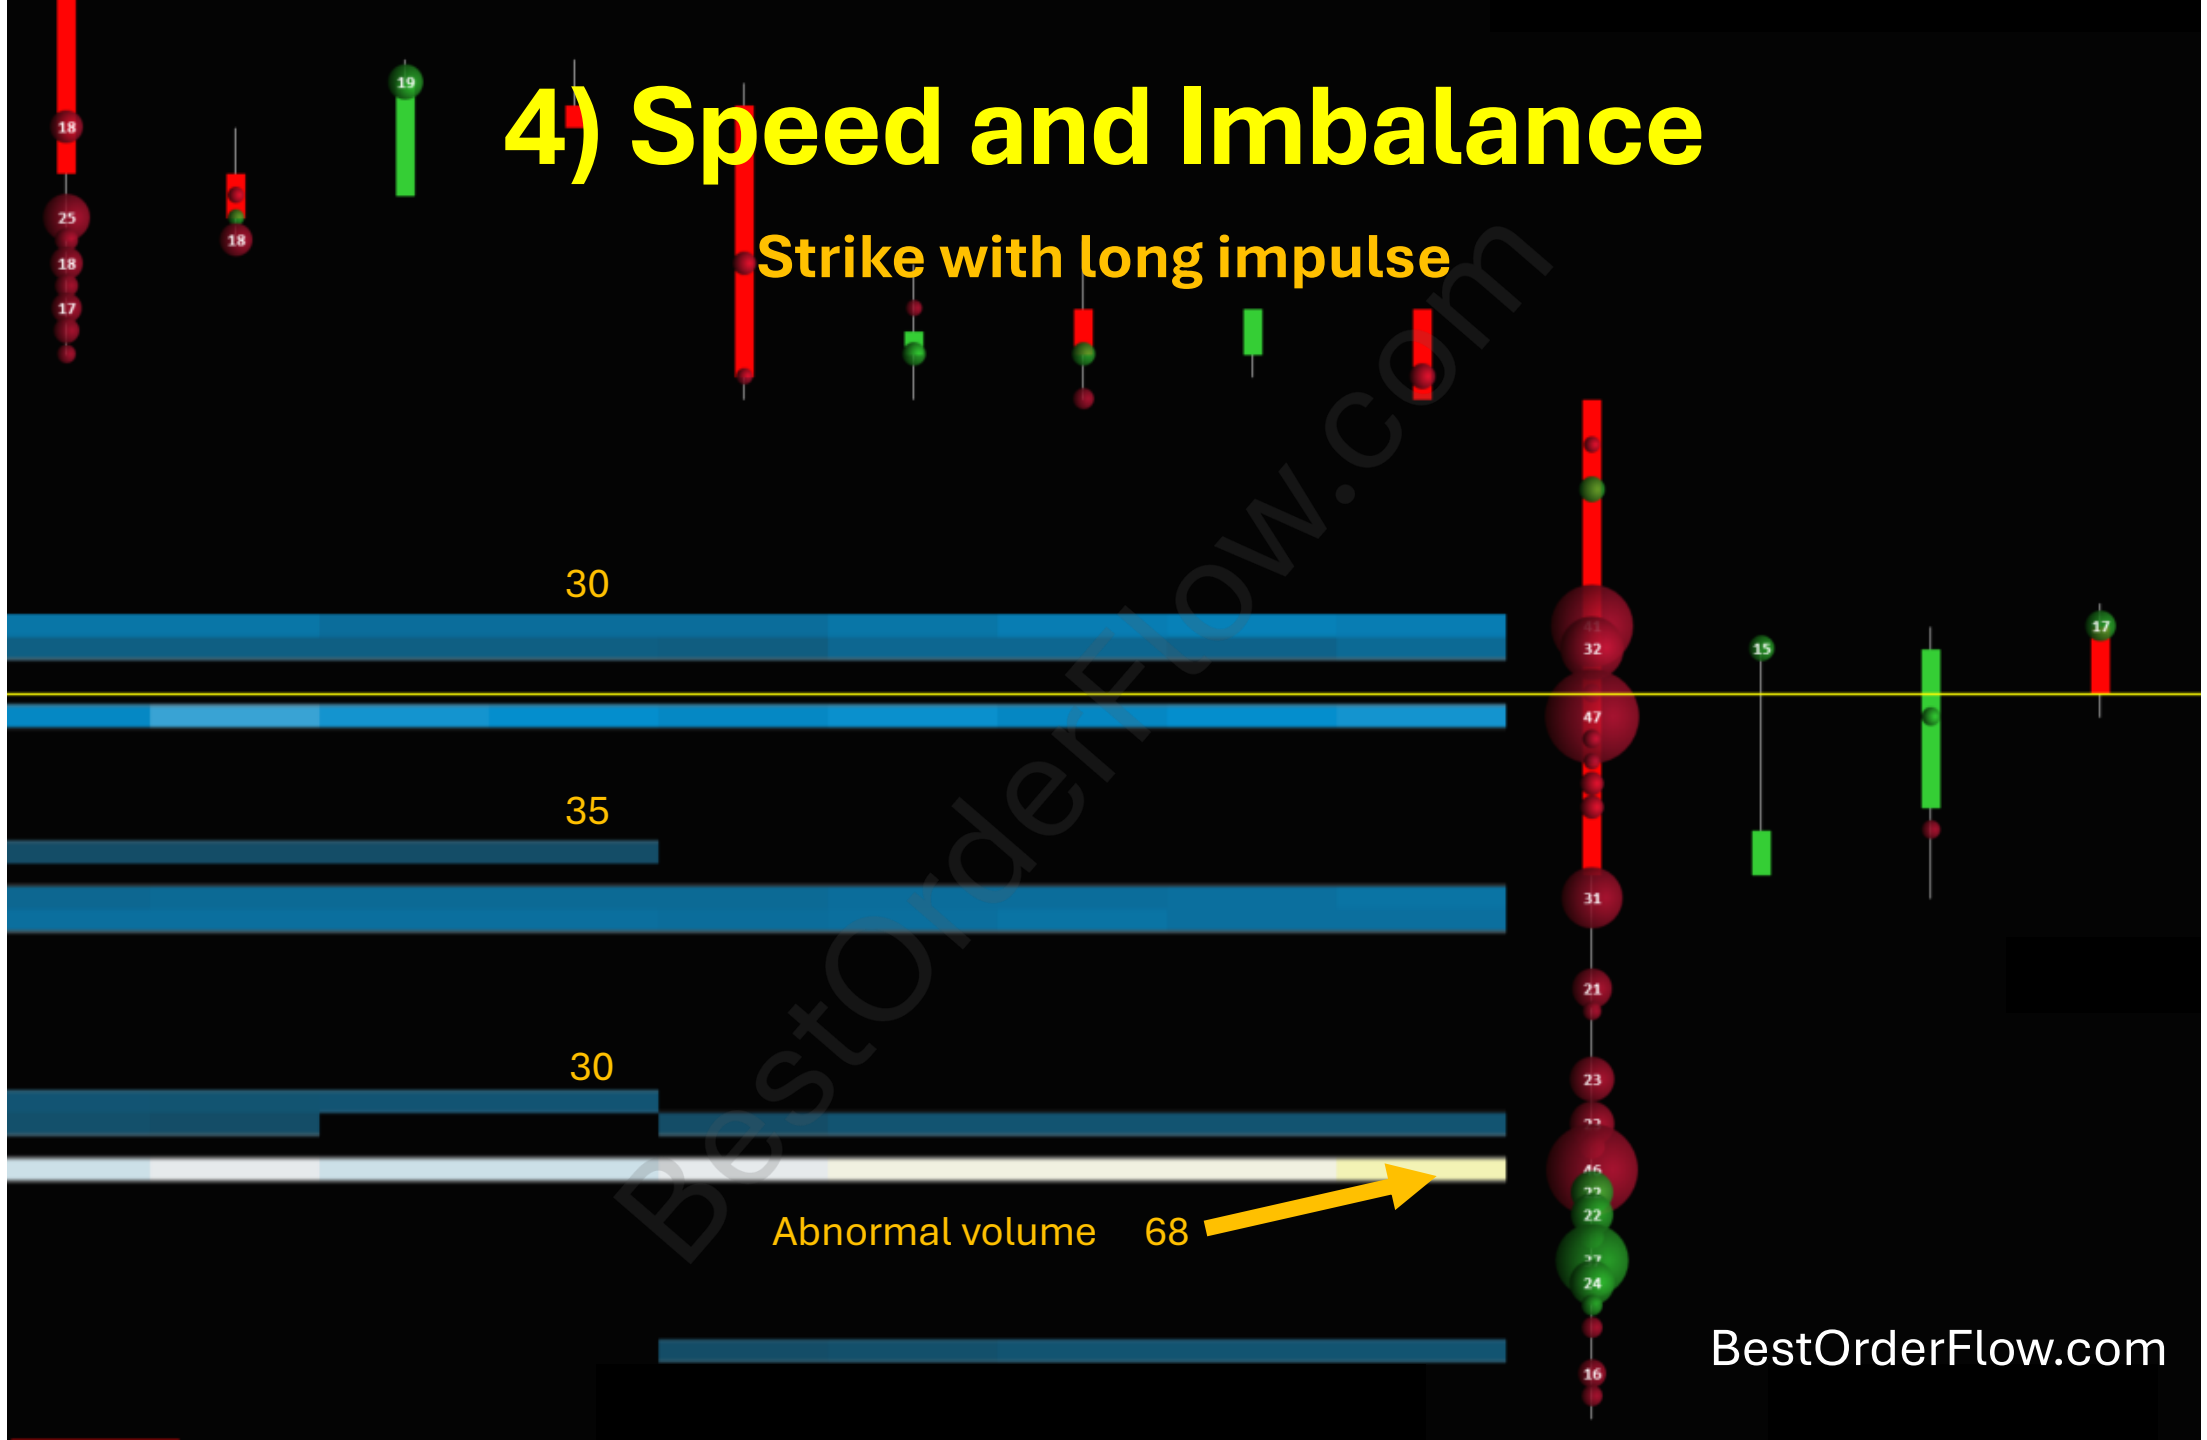

3) Distance of the biggest order to Que on MBO

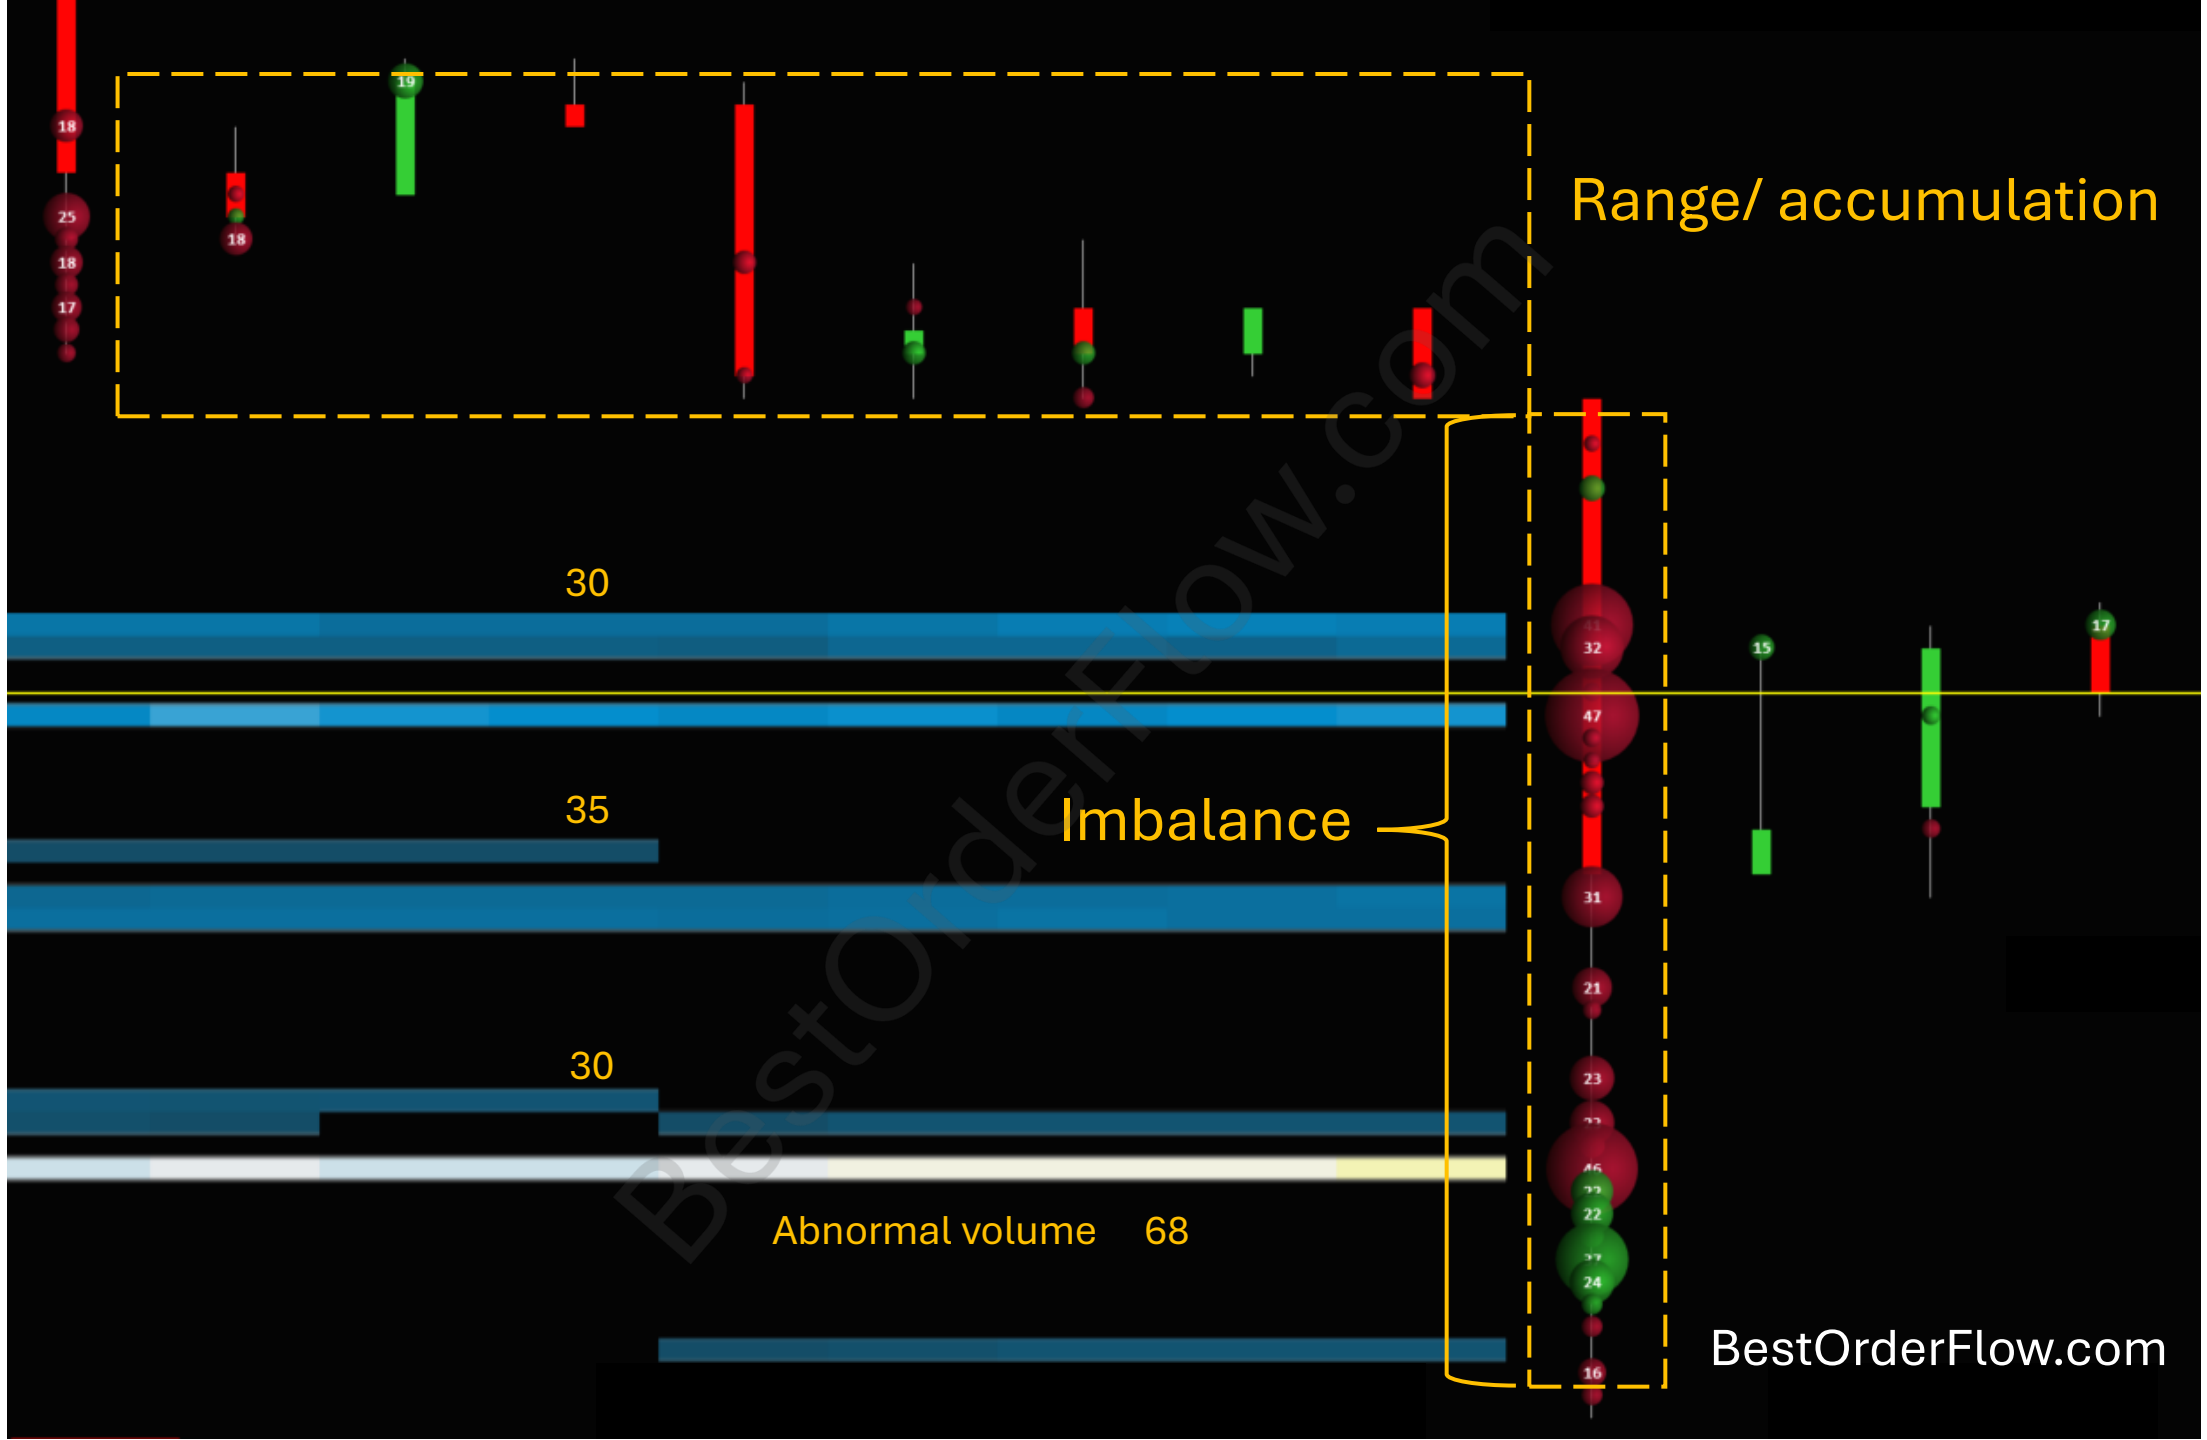

BestOrderFlow.com

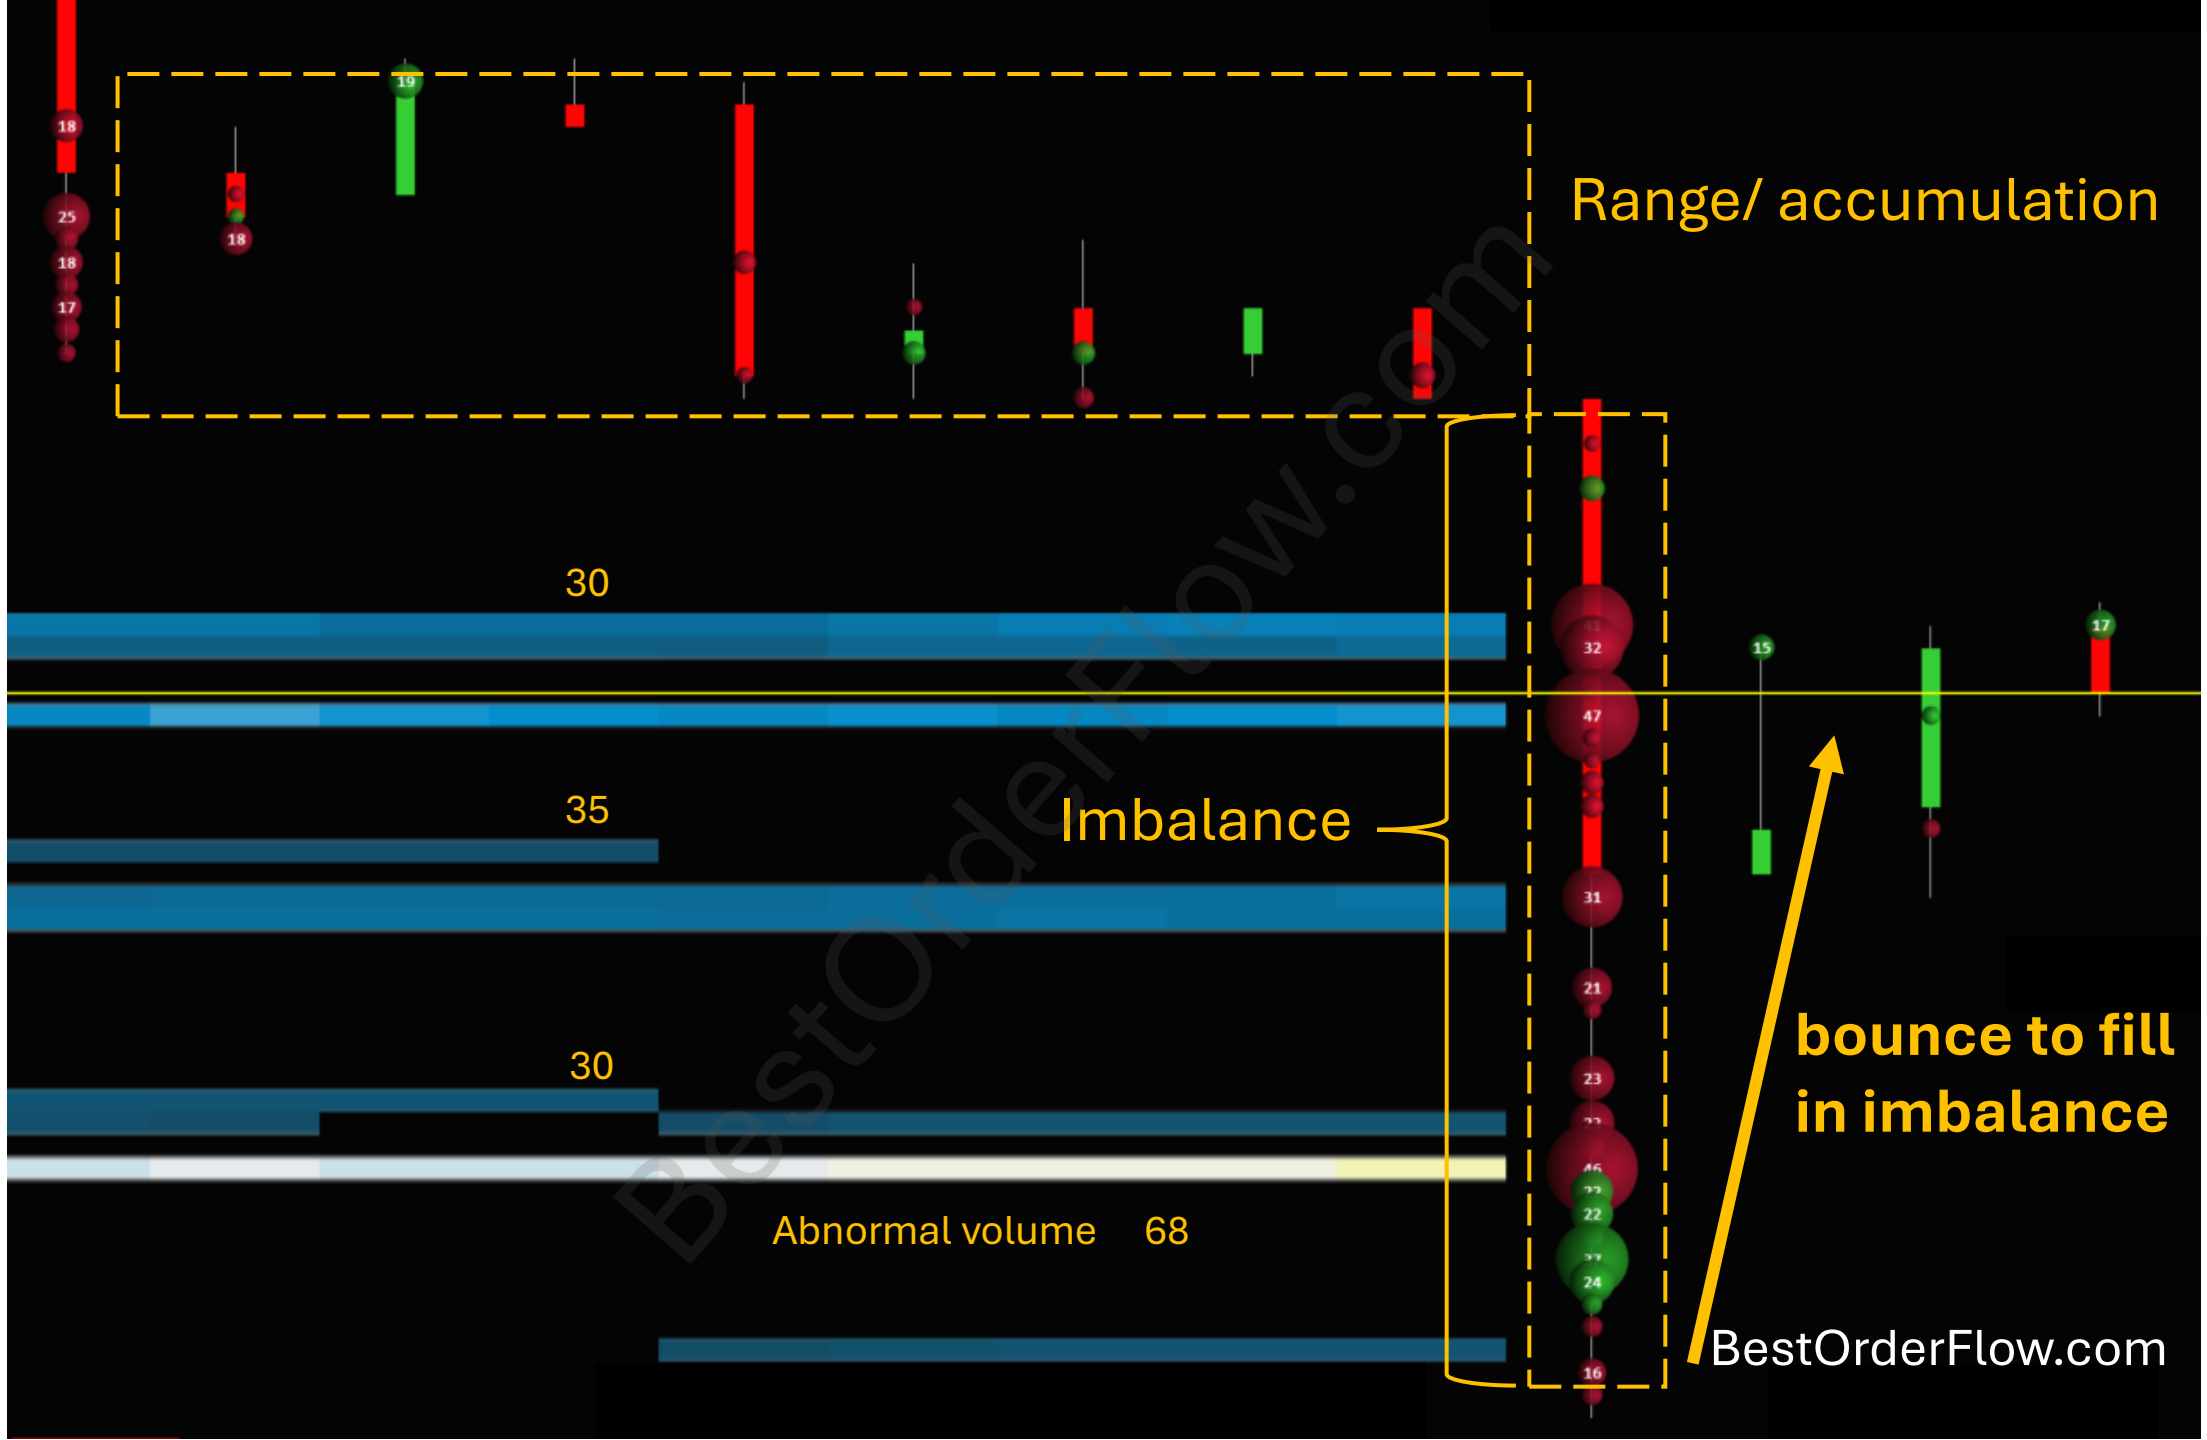

The closer the biggest order to the que – the more reliable this order is. Avoid order flipping in the last second prior to execution

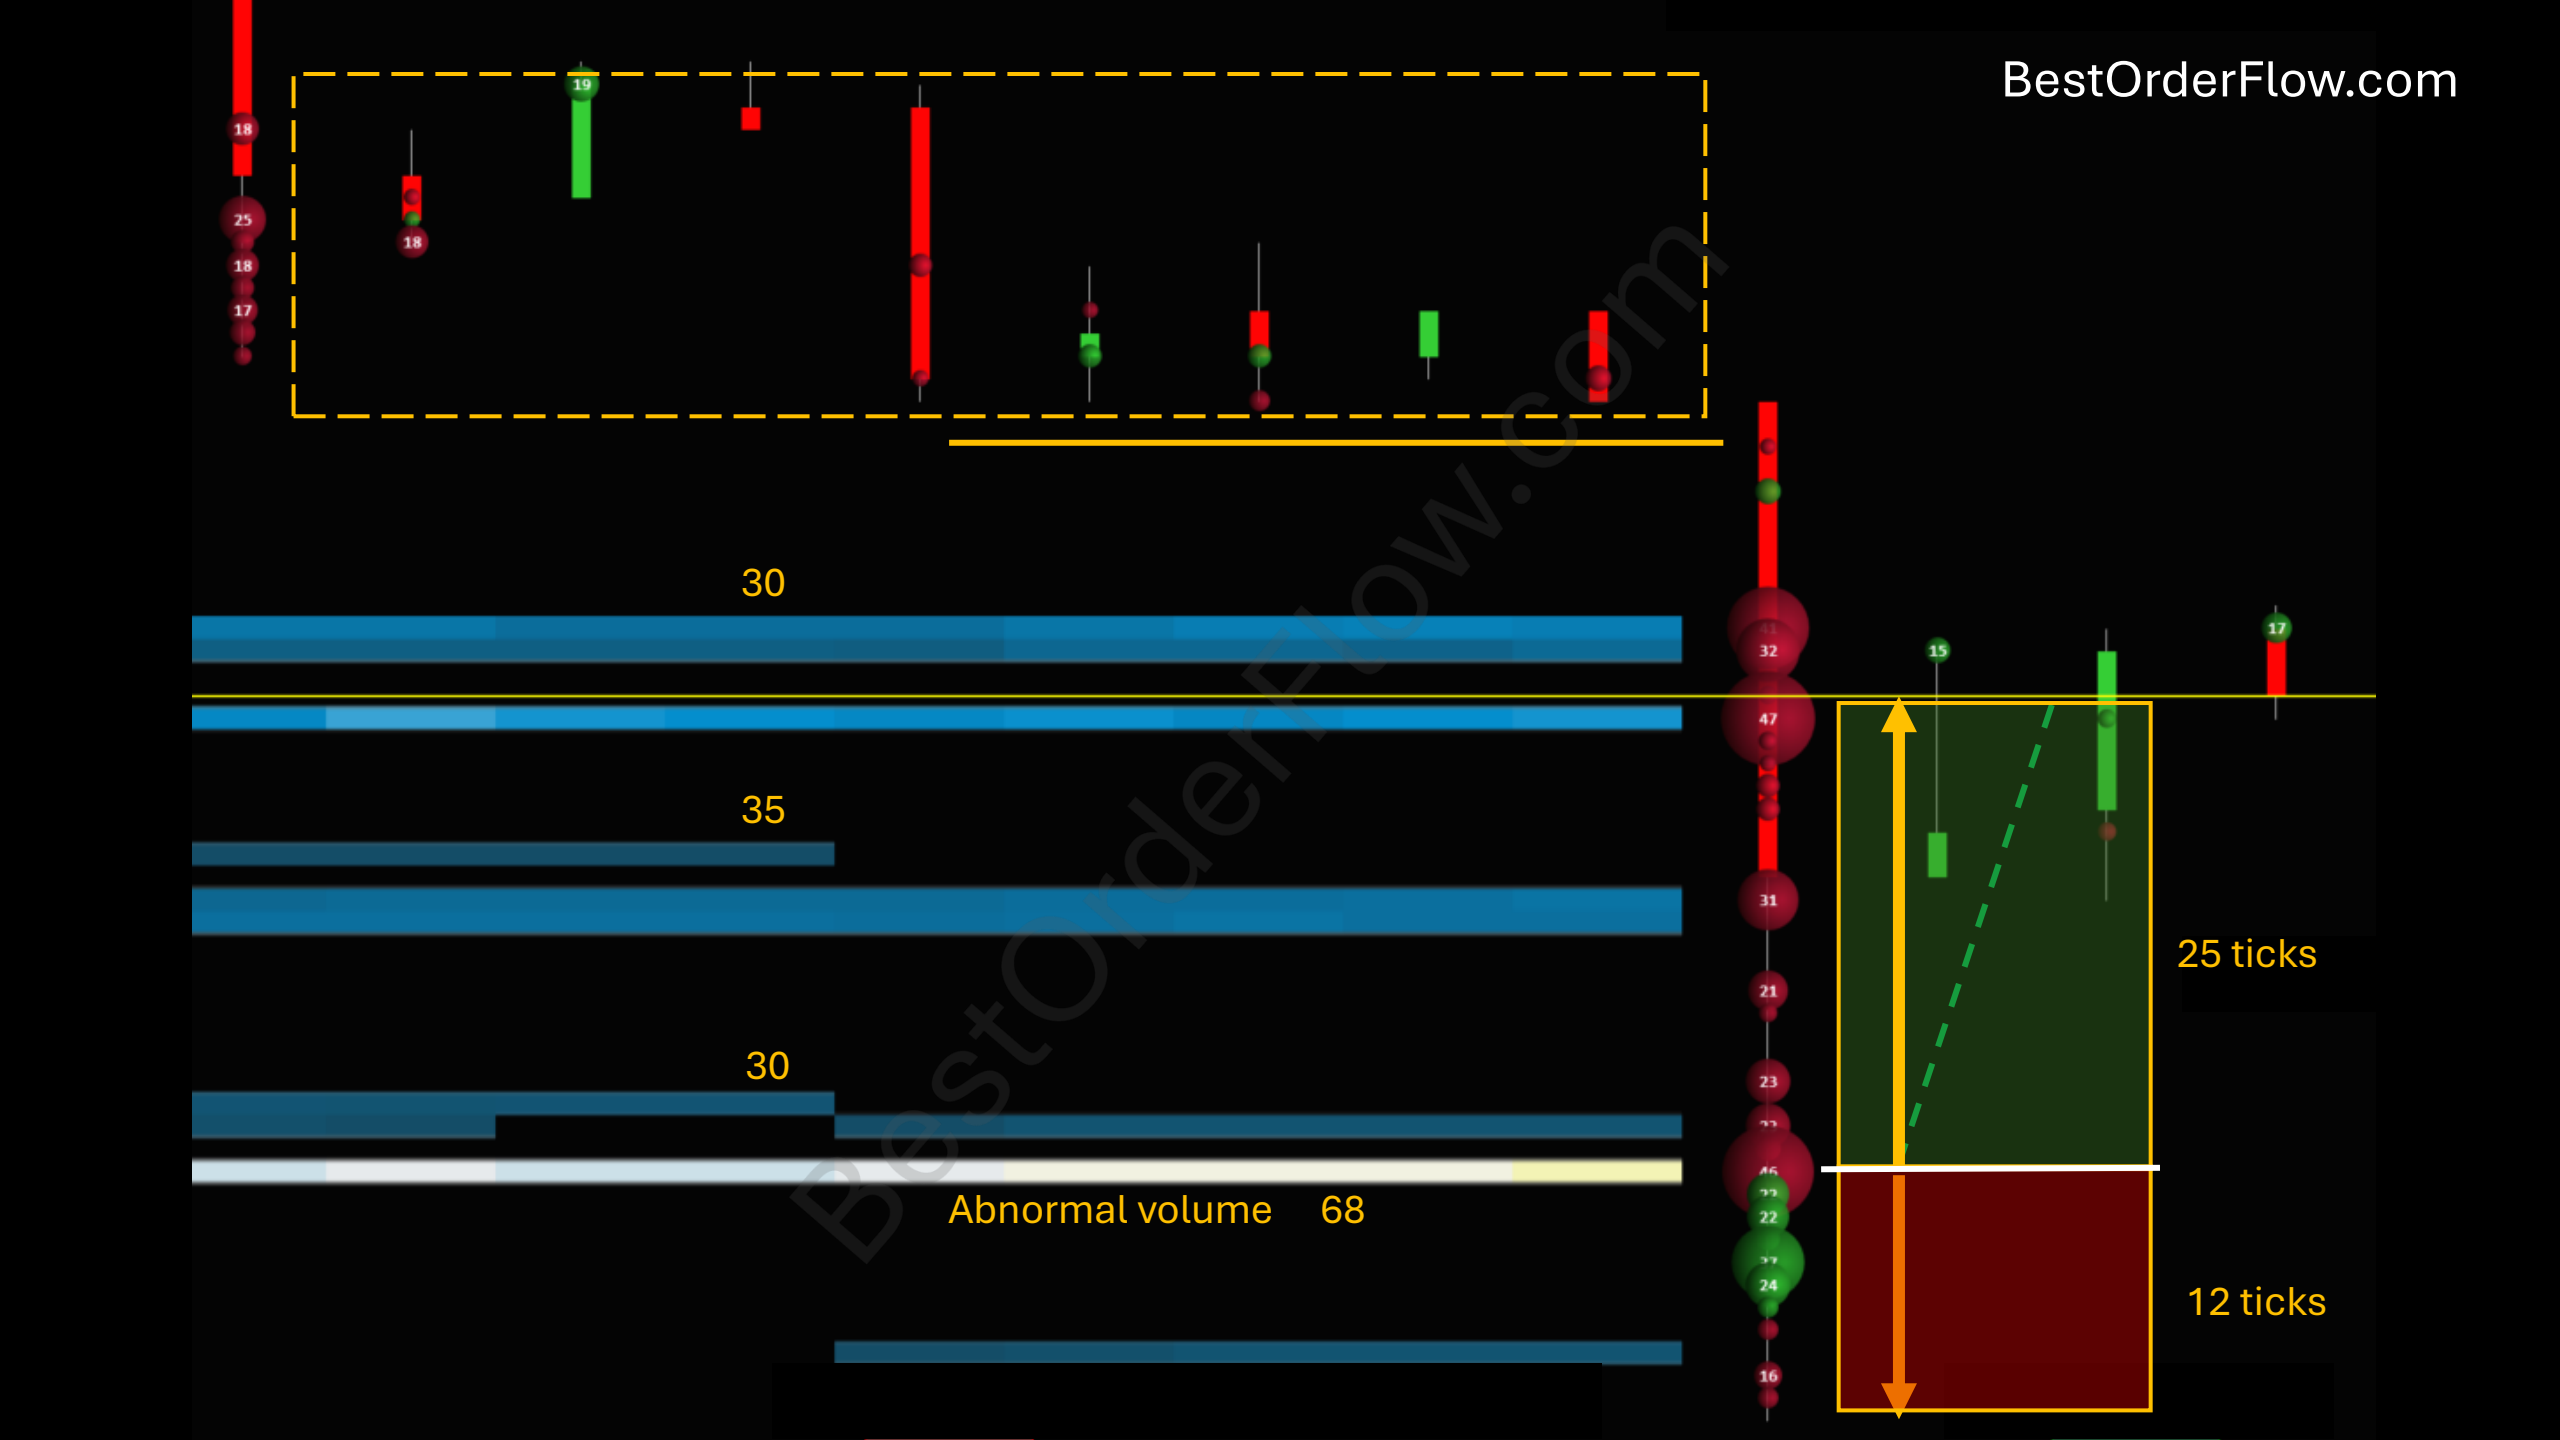

BestOrderFlow.com

4) Speed and Imbalance

Slow speed + range + short bars

BestOrderFlow.com

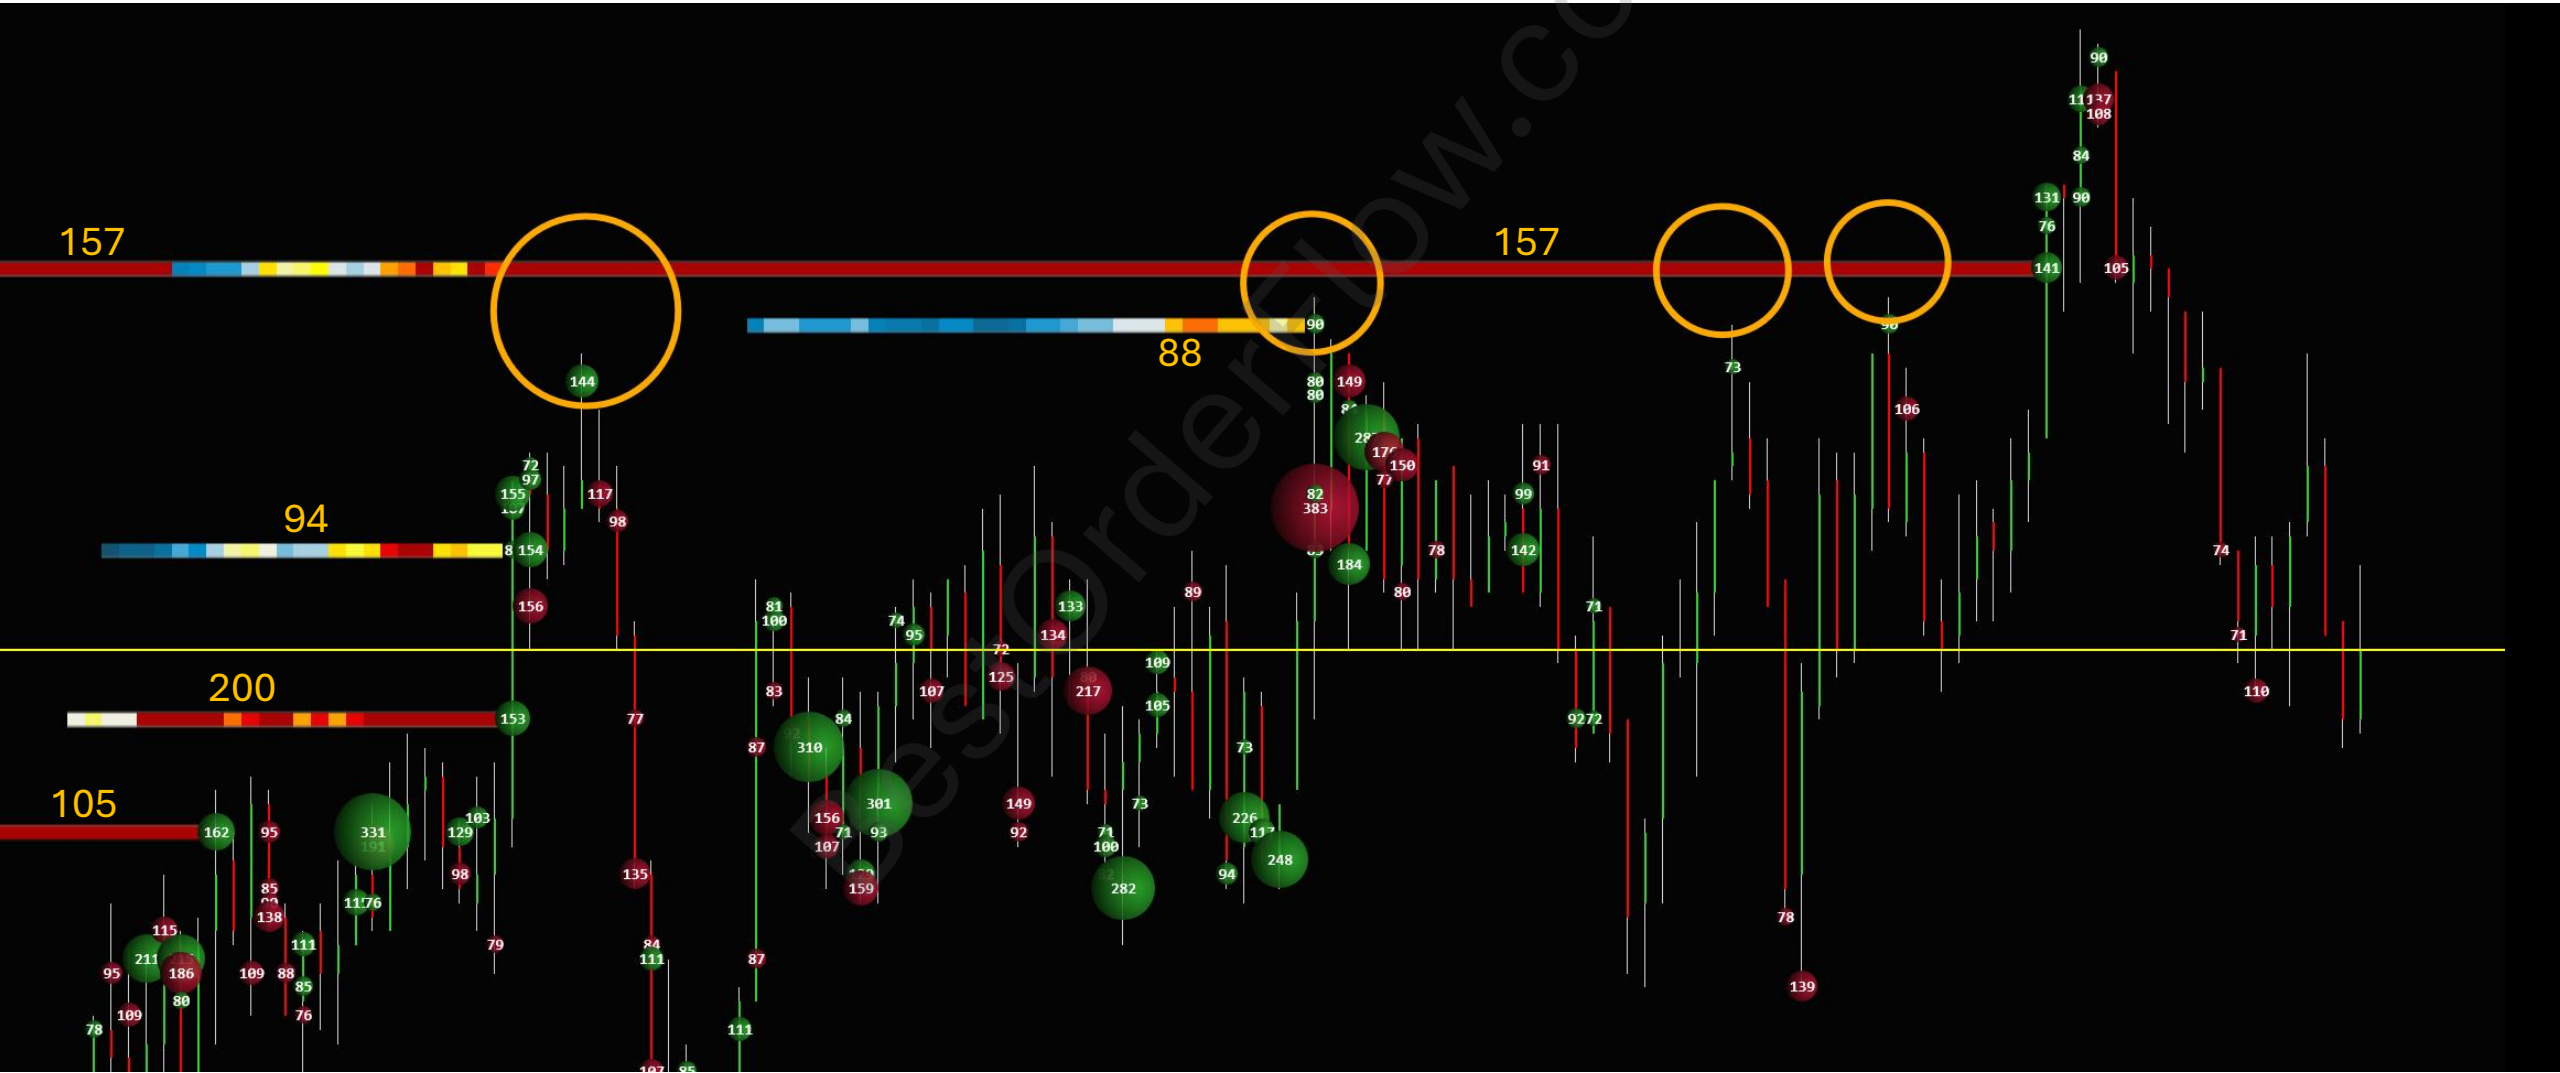

Avoid slow + multiple touch

BestOrderFlow.com

Avoid slow range + multiple touch

- Price spend time near price line
- Short slow candles

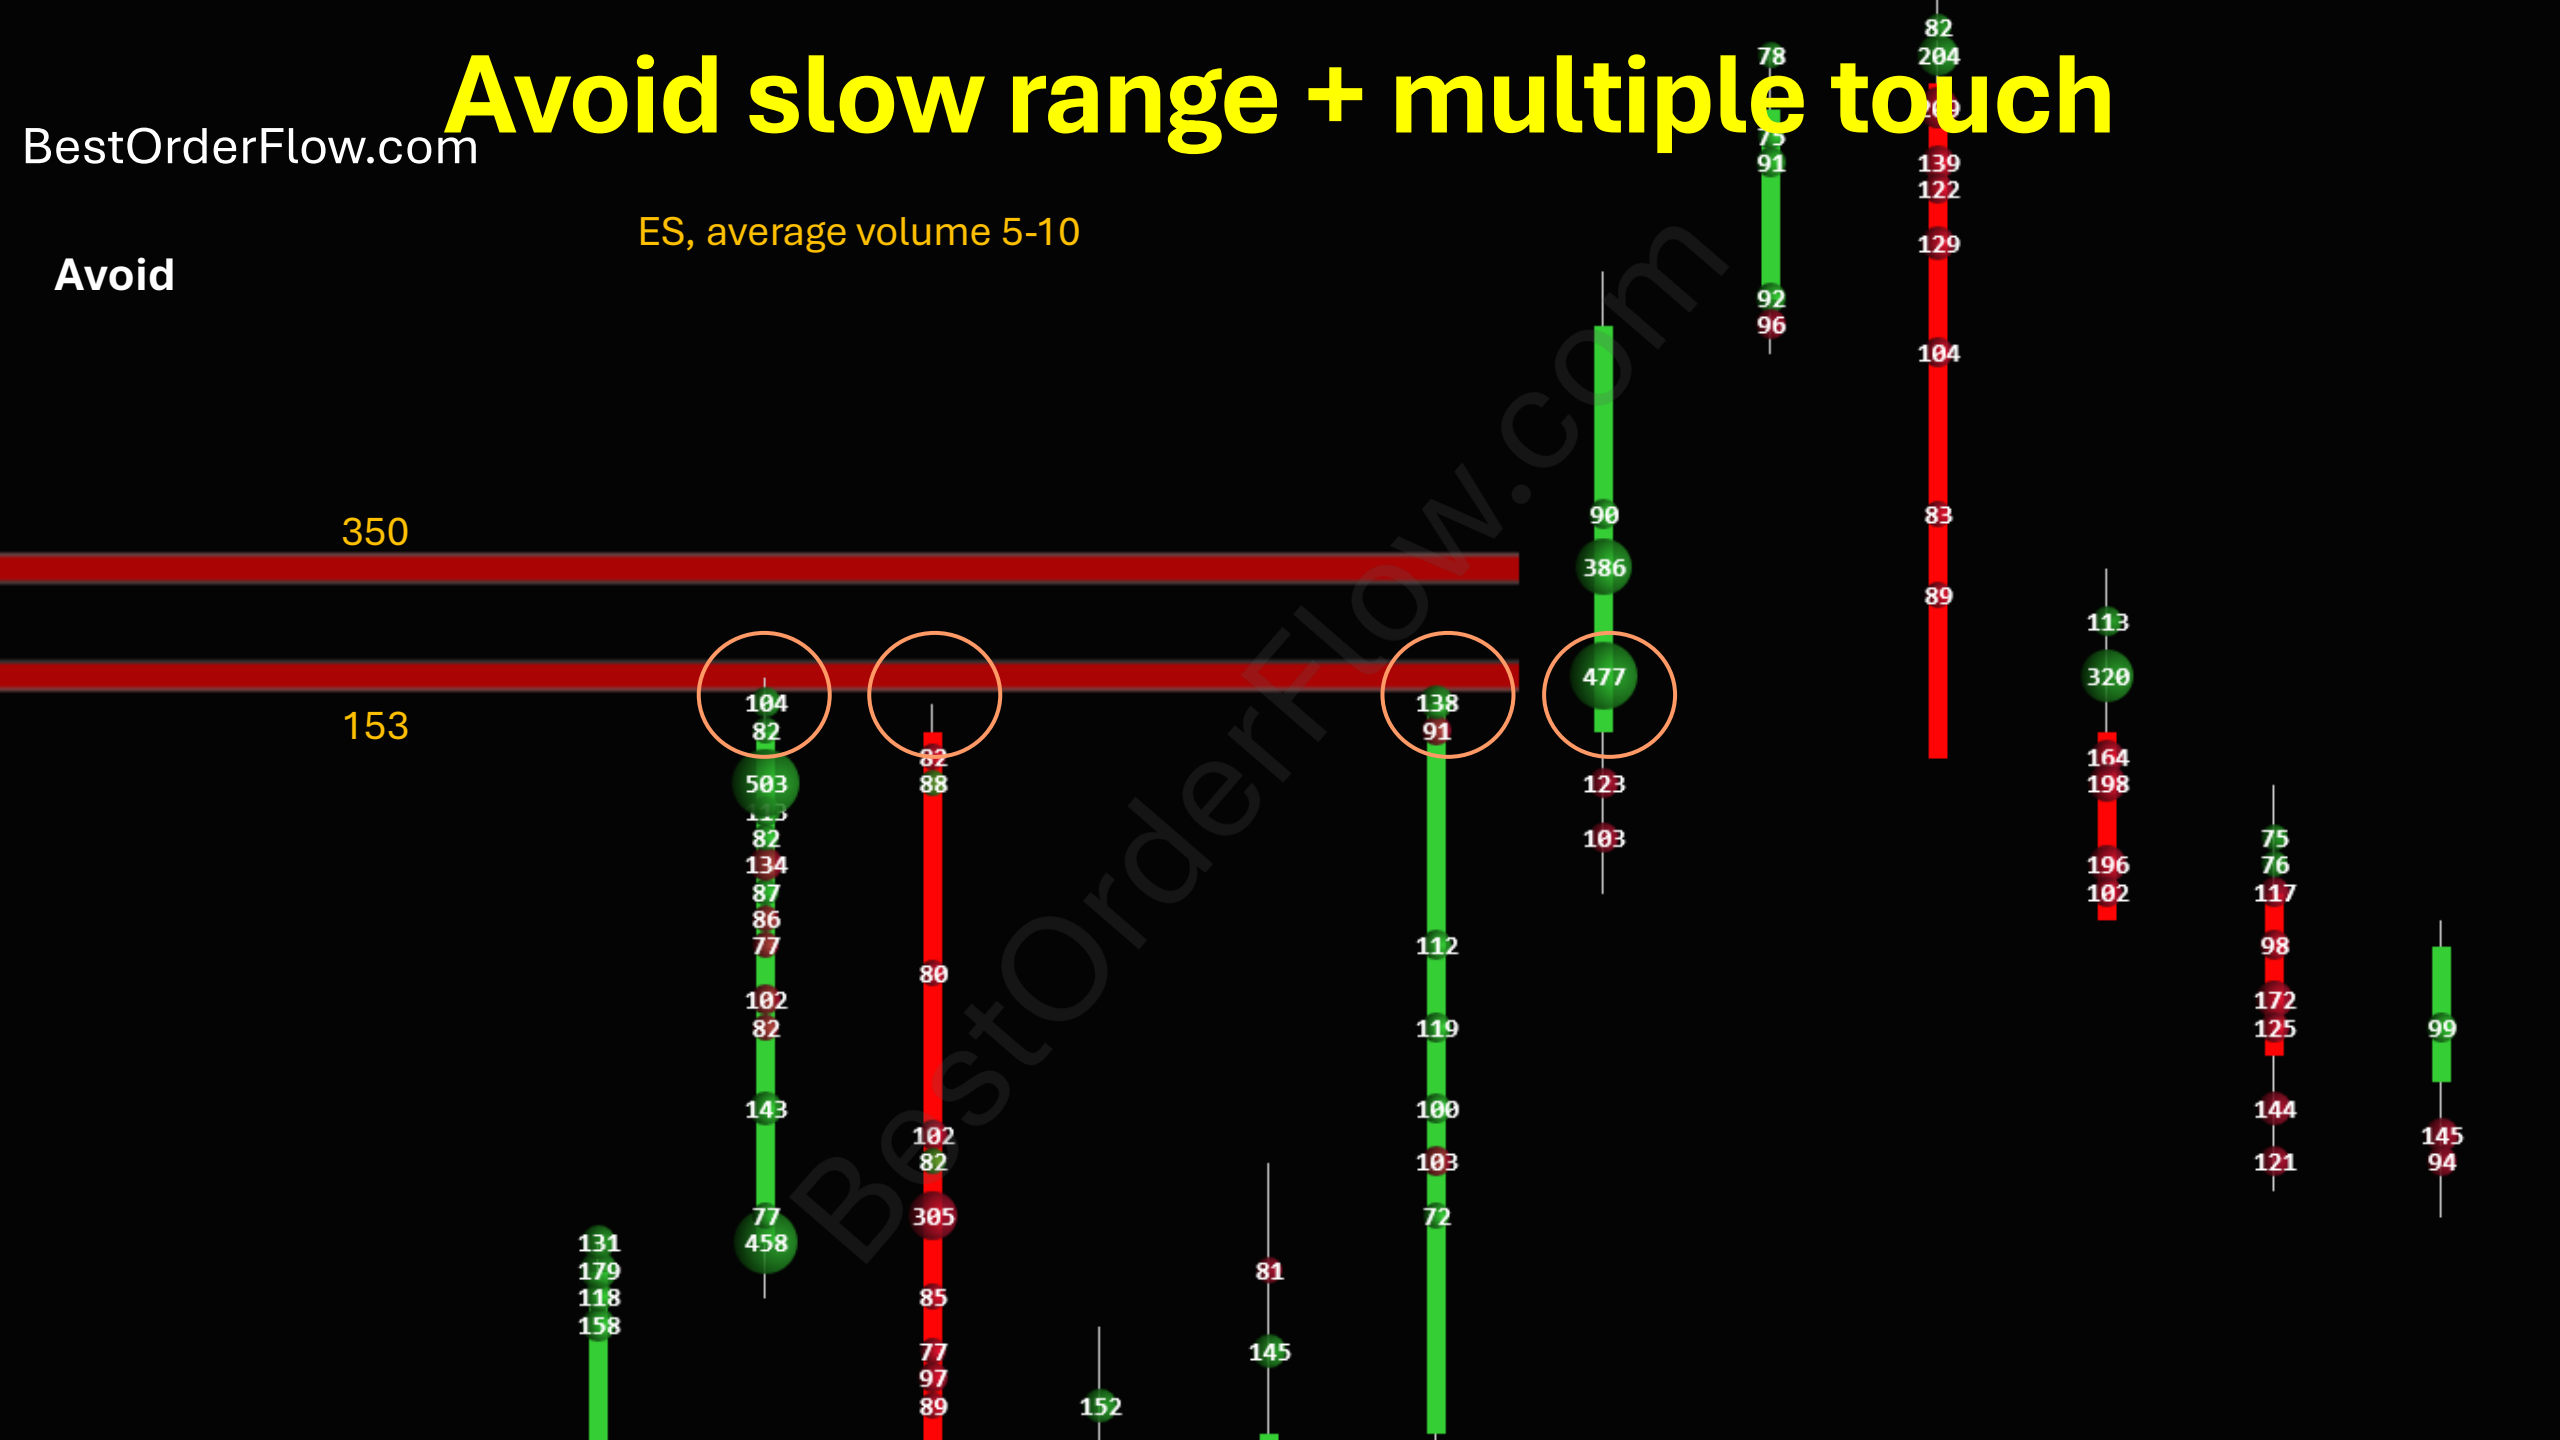

Avoid slow range + multiple touch

BestOrderFlow.com

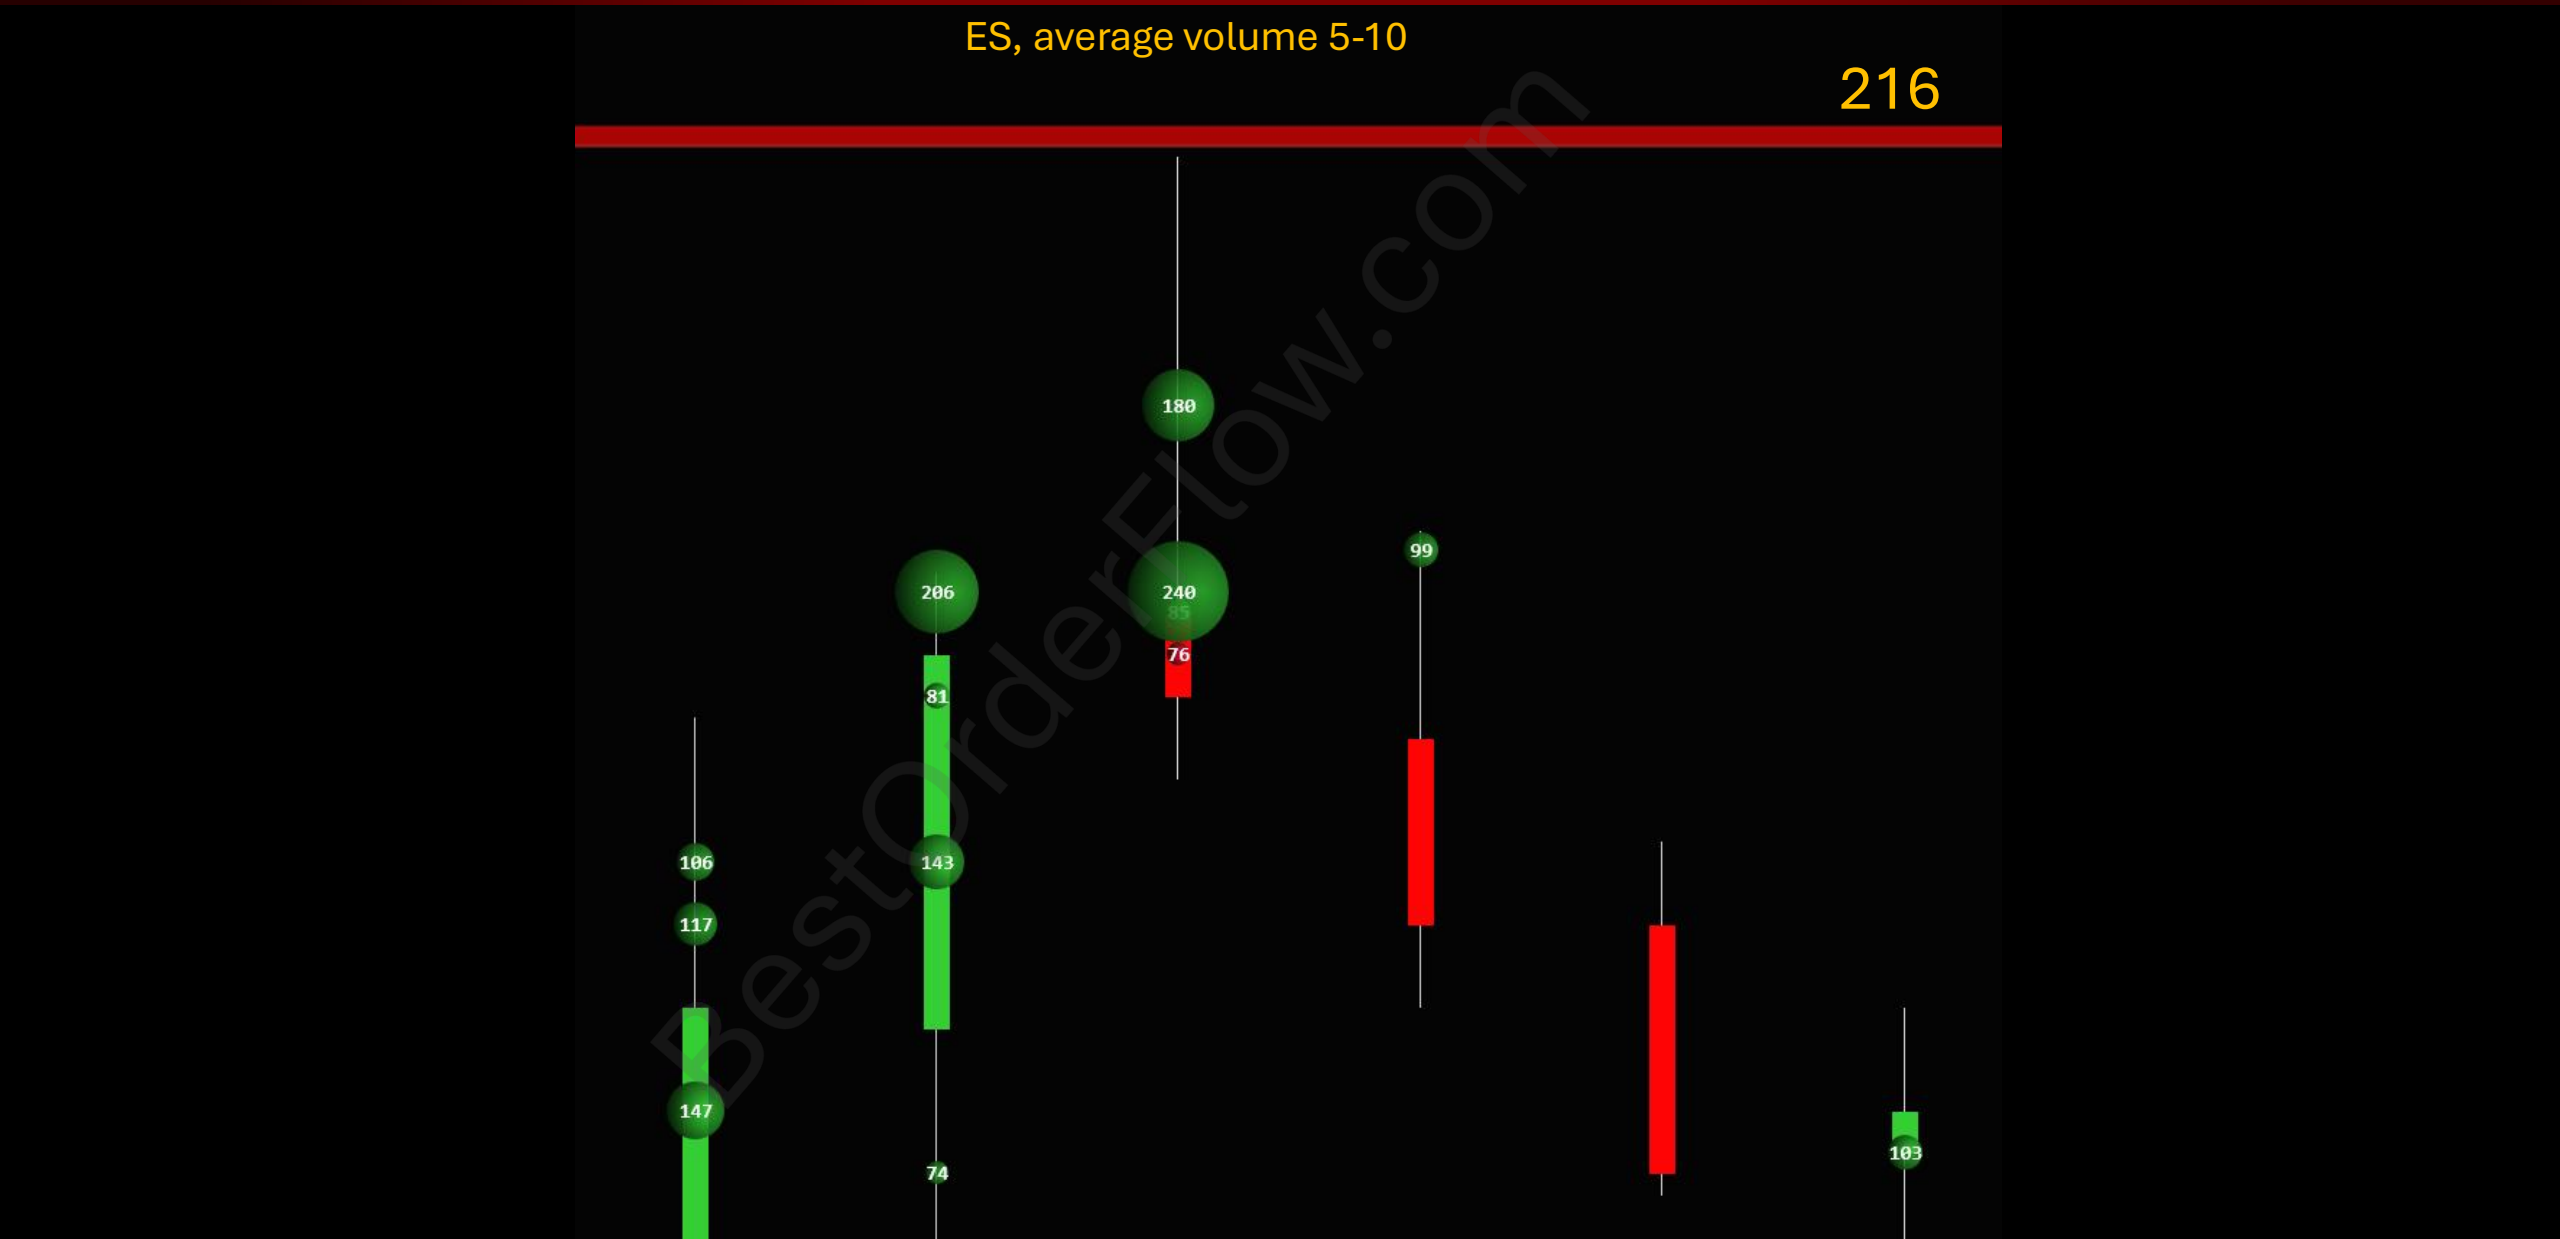

ES, average volume 5-10

Avoid

Fast speed = strong price reaction

Collect Statistics

Example

Total #	Volume size	Times	Time	Fast Strike	Slow short candles	False brakes	False brakes ticks	To que 3-5	To que 10 +
20	Reactive 50 – 70	30	10 minutes	2 times	18	2	10 ticks	5	10
10	Abnormal 200- 300	10	20 minutes +	9 times	1	4	6 ticks	15	5

1) Time period: check MNQ 30 seconds chart within 3-5 las days

2) Session: focus only on one session – Asia session: starts after NY close brake and before London session

3) Volume history: Historical Level 2 on Heatmap NT. Collect stats volume Level 2 orders for price reaction/bounce:

- **abnormal volume**: 10 x– 20 x times above average that price reacted strongly – about 10 ticks or more
- **reactive volume**: -smaller than abnormal that price reacted from at least 6- 10 ticks

4) Historical time length

5) Distance of large order to Que – close or far from the que – less then 10 orders – is close, more than 10 orders - far

6) False Brakes:

- record **percent** of immediate false brakes.
- record false brakes **depth in ticks**

BestOrderFlow.com

BestOrderFlow.com

Rule 1: strong price reaction

Heatmap NT indicator – display time and historical volume
– it can be abnormal and large volume
– it can be taken away 1-2 tick prior

MBO Indicator – shows real volume **at the moment**.
MBO Indicator – C= contract count. The more the count better condition

- The more contract counts compose that volume - the better, because more other participants exist on the same price level

1) **Trigger:** Volume + Time
   - Find abnormal volume on MBO with
   - Long time on Heatmap
   - As close to **que** as possible – less than 6 –or 4 ticks
   - Large V + Large C : abnormal Volume surrounded with a lot of smaller contract count - is a plus factor

2) **Place limit order** one tick in front of the abnormal volume or one tick below

BestOrderFlow.com

BestOrderFlow.com

Rule 2: Strong price reaction

Good trading conditions:

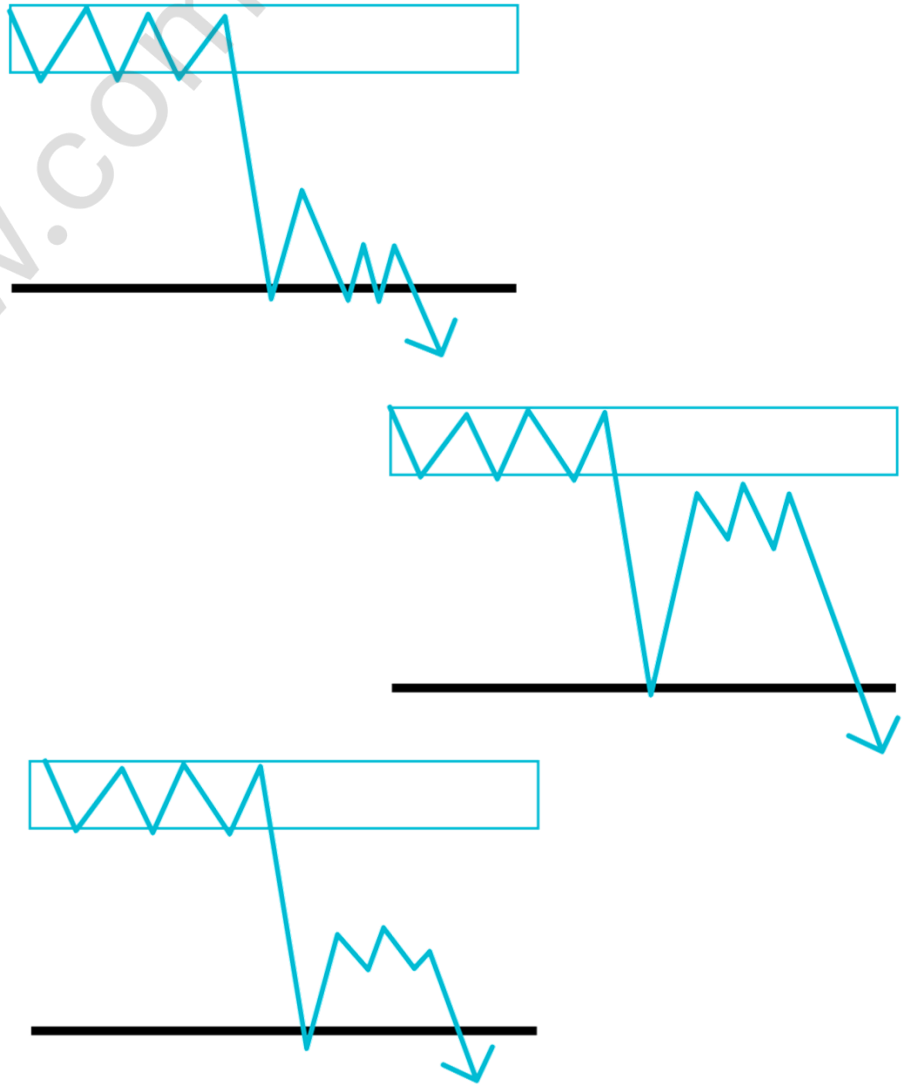

- Abnormal volume, large contract count
- Price attacks from distance – 4- 6- 10 or more ticks
- Most likely get good price reaction and bounce 4-8 or more ticks

- We do not chase price on any direction by any reason.

  We are building our stats for this strategy alone not contaminated with any other strategies or methods.

No price chase:

- Price may reverse at any time
- Price may keep going below
- Price may spend time in a range

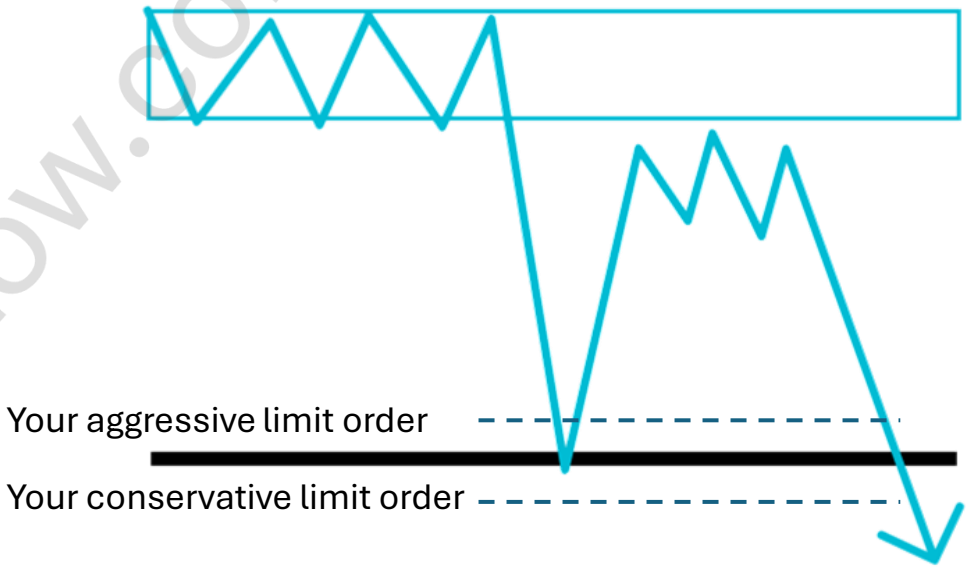

BestOrderFlow.com

Rule 3: Pull back or Reversal

BestOrderFlow.com

1) Pull back for continuation

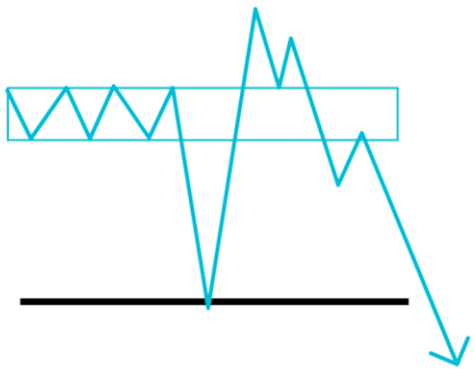

- Price may reverse at any time – no price chasing
- Price most likely reverse from the beginning of extension or near range to keep the same trend direction

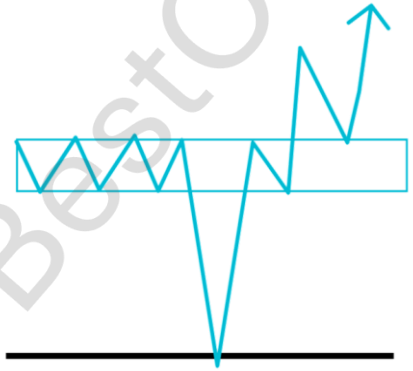

If price after reaction able to brake previous structure wait directional confirmation before placing next order:

2) Confirmation below the broken range structure

3) Confirmation above the broken range structure

BestOrderFlow.com

Rule 4: Questionable conditions

BestOrderFlow.com

1) **Questionable condition**:

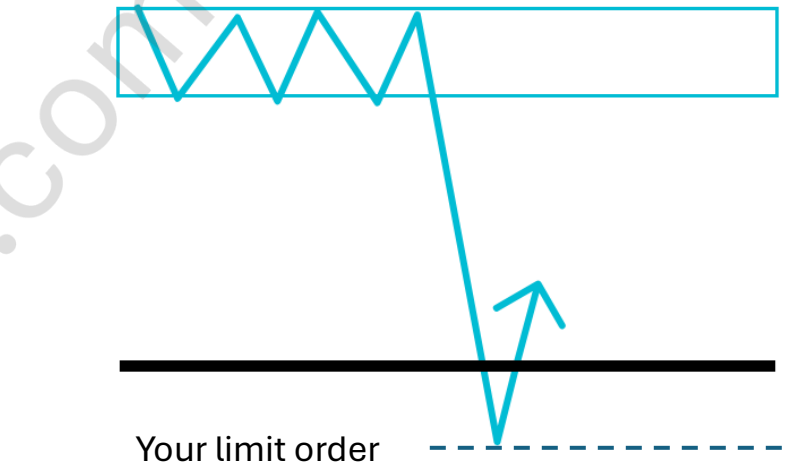

If the level is not abnormal volume but somewhat large.

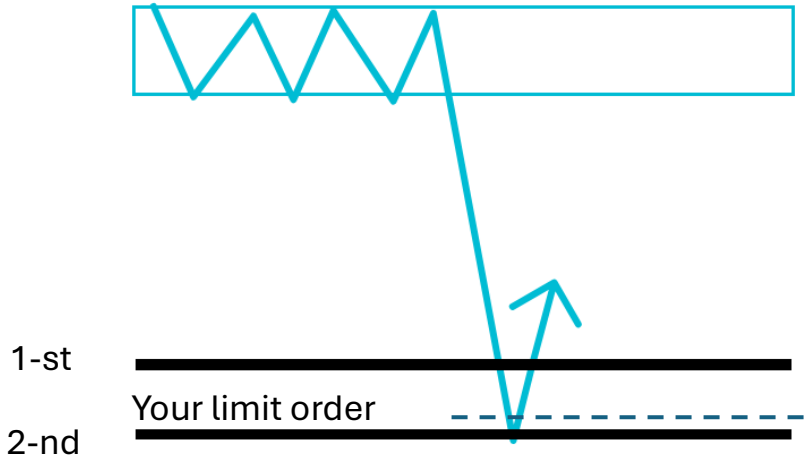

Protect yourself from Stop Loss with possible brake that price level:

- Place your order **4- 8 ticks behind** that price volume factoring in brake trough before possible bounce

- Place your order behind that weak volume and in front of **next level 2 resistance** volume that may hold the brake trough.

- **Completely remove your order** to be on a save side and avoid negative trade. Use only Ideal conditions that lead to a 100% win rate is the best choice. Less trades with higher possibility will grow your confidence fast.

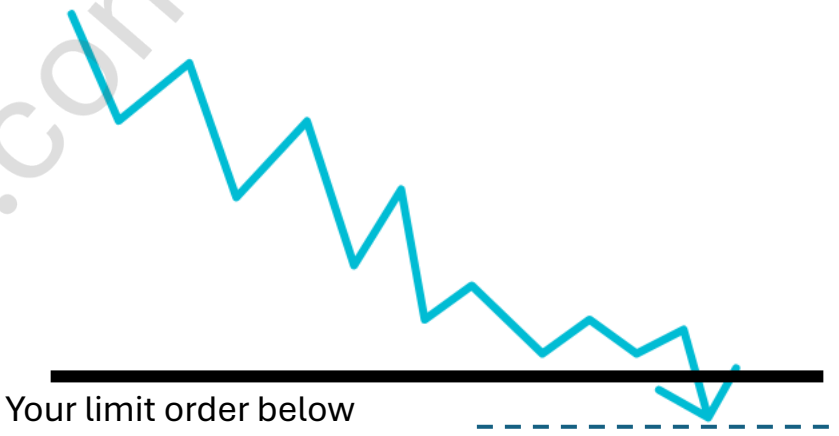

BestOrderFlow.com

BestOrderFlow.com

Rule 5: slow and short candles

Weak condition – price **approach slow or with short candles**

- Place your order 4- 8 ticks behind the level.
- Place your order behind that volume and in front of next large volume resistance volume that may hold the brake as volume accumulation.
- **Completely remove your order** to be on a save side and avoid negative trade. Use only Ideal conditions that lead to a 100%-win rate is the best choice. Less trades with higher possibility will grow your confidence fast.

BestOrderFlow.com

Trade management

During the trade watch closely the price behavior movement toward your limit order for execution:

1) Price attack – quick move with long leg from a distance

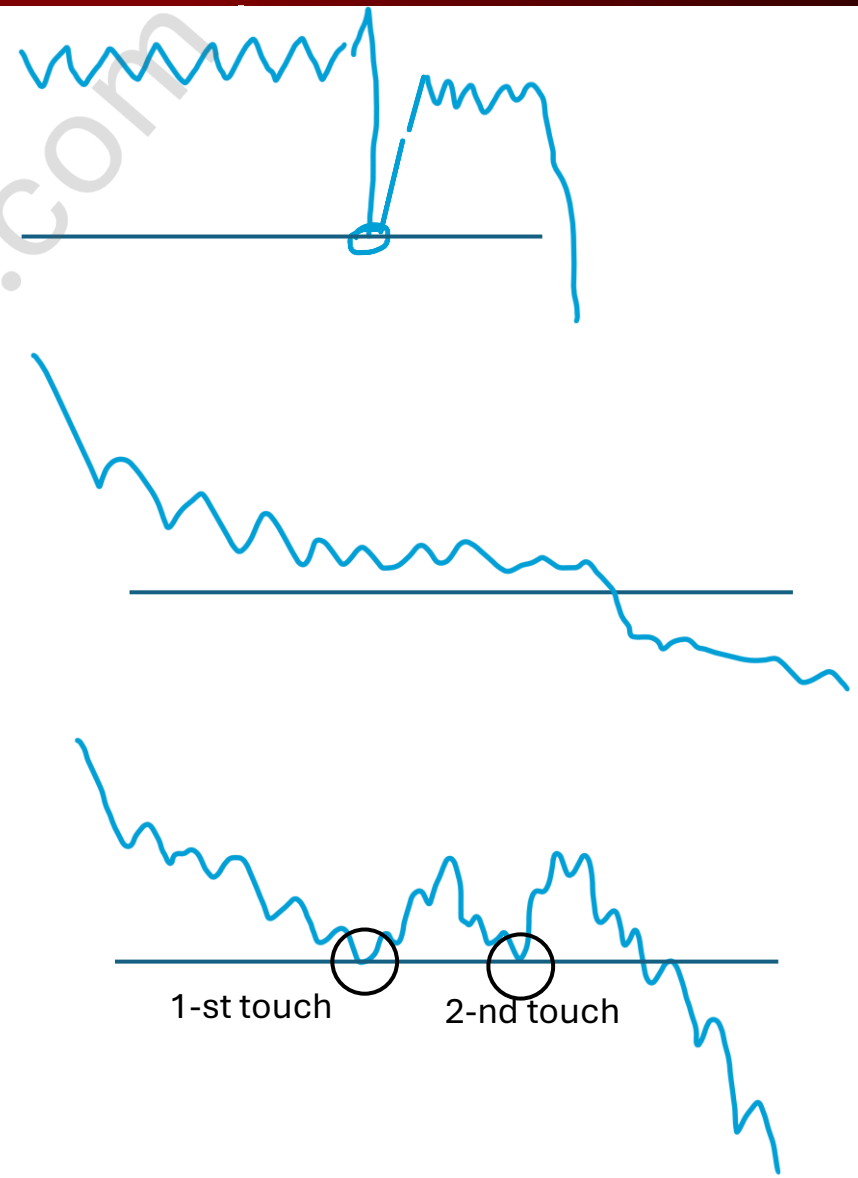

Outcome:
- this is sign for possible price bounce and
- high chance for quick profit take.
- **keep the trade**

2) Lazy price moves: Price moves slowly closer and closer with a range or short candle bars

Outcome**:**
- most likely price will get trough with some small reaction.
- cancel the trade

3) Second touch:
If price get very close , almost touched high volume level and got weak reaction. After small pull back price approaching the same level again and touch 2-nd time or most likely go trough

Outcome:
- price will get trough with small reaction
- cancel the trade after 1-st touch

Spoofing and Layering

Placing and removing liquidity

1) **Placing** large or abnormal passing orders (271, 389, 270) as a magnets to attract attention and move price toward that liquidity
2) Orders get **removed** 1-2 ticks prior price get close to those orders.
3) The goal of **spoofing** is to manipulate price and move it toward the liquidity on level 2
4) Under the 2010 Dodd- Frank Act spoofing is defined as “the **illegal practice** of bidding or offering with intent to cancel before execution”

ES average volume 5-10

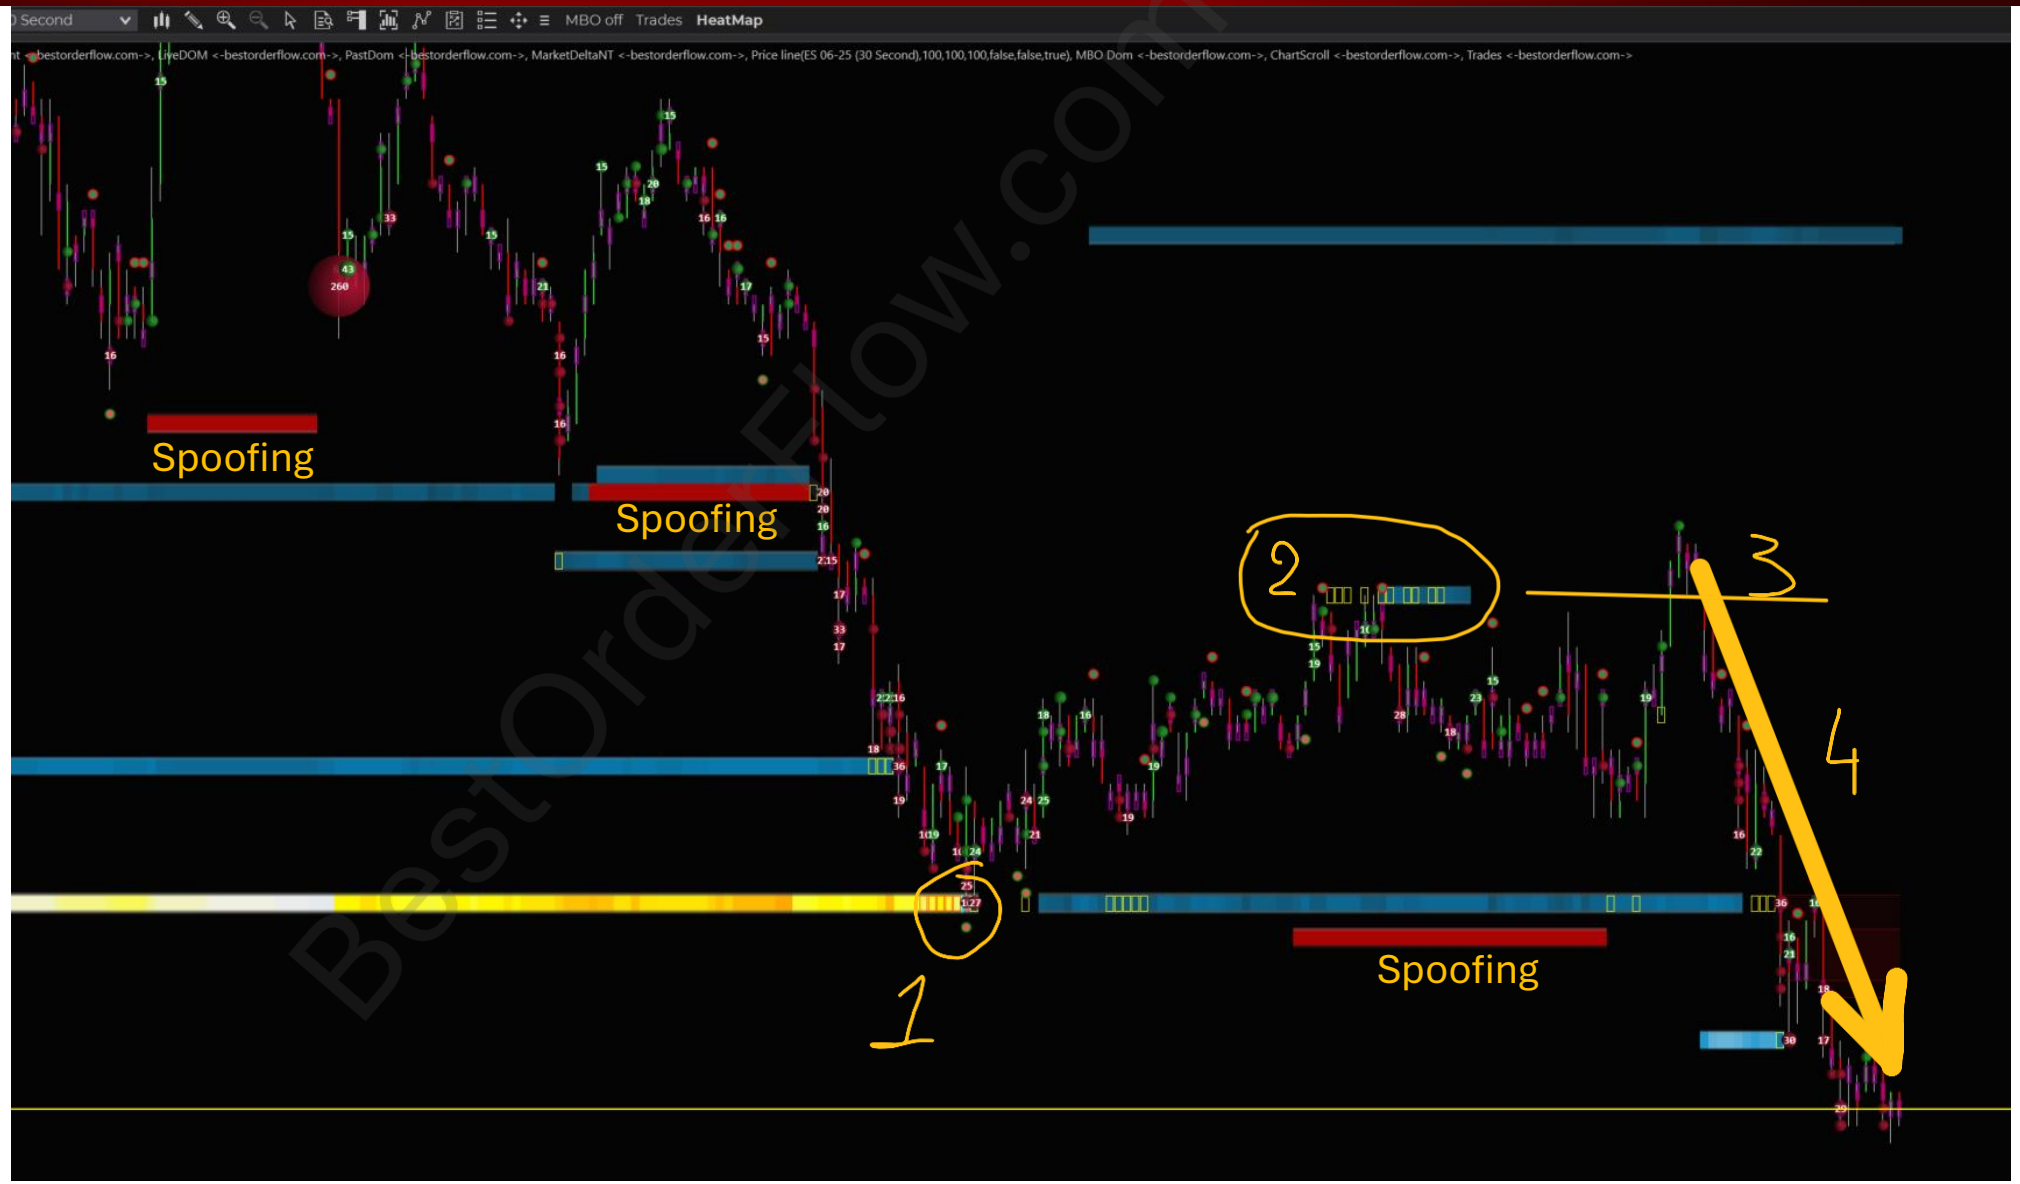

ADVANCED

BestOrderFlow.com

Sweeping – strong vertical fall

1) Bounce from strong support
2) Exaction near weak resistance
3) Second exaction
4) Strong move

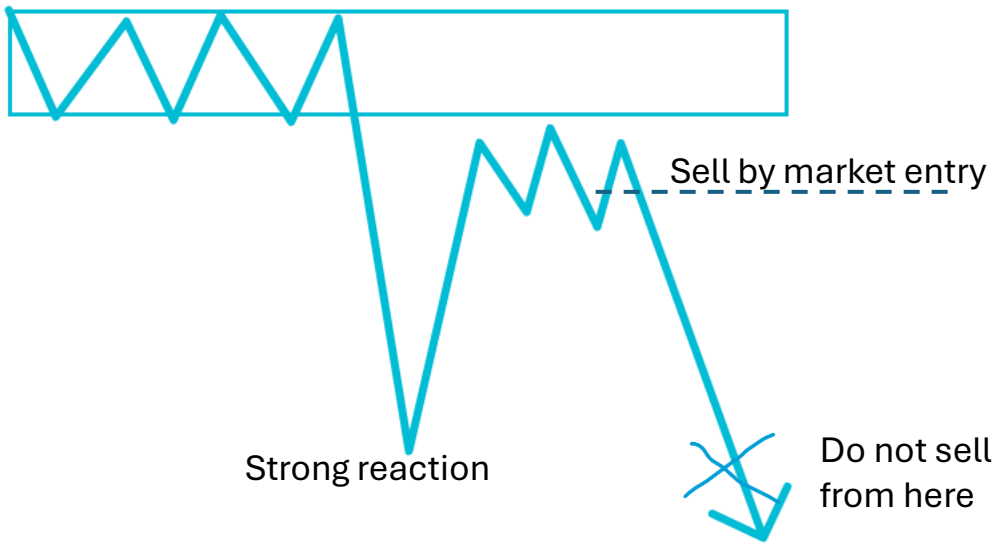

Advanced trade after strong reaction

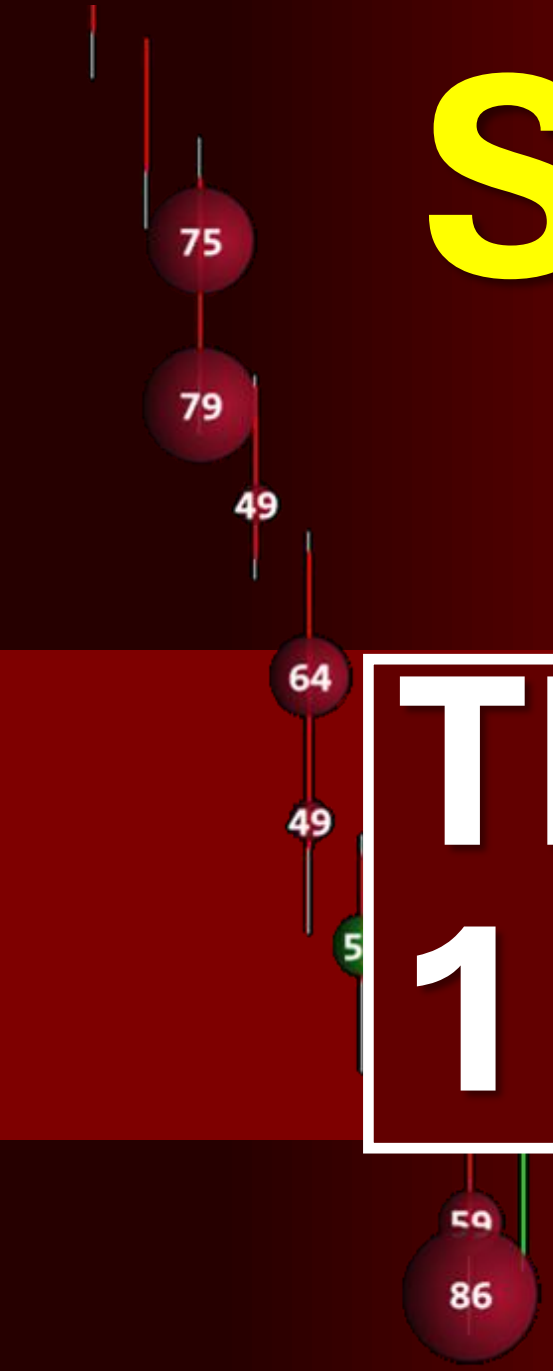

BestOrderFlow.com

If price attacked large volume level with strong reaction.

1) Wait for bounce exhaustion:
   - low volume, short candle bars , pig tails – all signs of a reversal.
2) Possible price reversal near beginning of extended candle or range.
3) Consider entering after price reaction on reversal toward momentum continuation.
4) Monitor real time Volume on MBO and consider toward price momentum if volume on MBO is low.
5) Must understand co-factors, reversal patterns like pig tail, delta 2 pulling and stacking.
6) Enter from the edge of reversal, as far as possible from previously high-volume level.
7) Entering right before previously strong level is dangerous. Must concern about large Stop loss. Aggressive entries going to kill your confidence and statistics.
